1.1.2 Modern Encryption

- **AEAD Ciphers:** AES-GCM (128/192/256), ChaCha20-Poly1305, Serpent-GCM, Twofish-GCM
- **International Standards:** Camellia-GCM, ARIA-GCM (Korea), SM4-GCM (China)
- **Legacy Support:** AES-CBC/CTR/CFB/OFB/XTS, 3DES (for compatibility)
- **Asymmetric:** RSA (2048/3072/4096), ECC (P-256/P-384/P-521)
- **Post-Quantum Cryptography (PQC):**
 - Kyber-512/768/1024 (ML-KEM) - Key encapsulation
 - Dilithium-2/3/5 (ML-DSA) - Digital signatures
 - KyberHybrid - Quantum-resistant hybrid encryption
- **Classical** (educational): Caesar, Vigenre, Playfair, Hill, Substitution

1.1.3 Key Derivation

- **Argon2id** - Memory-hard, recommended
- **Scrypt** - Memory-hard alternative
- **PBKDF2** (SHA-256/SHA-512) - Legacy compatible

1.1.4 Compression

- **ZLIB** - Fast, good ratio
- **LZMA** - Best ratio, slower
- **BZIP2** - Balanced (coming soon)

1.1.5 Additional Features

- **Steganography** - Hide data in images (LSB)
 - **Archive** - Encrypt multiple files
 - **Hashing** - SHA-256, SHA-512, SHA-3, BLAKE2b, BLAKE3
 - **Benchmarks** - Performance testing
-

1.2 Quick Start

1.2.1 Windows (MSVC)

```
# Setup
.\scripts\setup-msvc.ps1

# Build
.\scripts\build-msvc.ps1 -Test
```

1.2.2 Windows (MinGW/MSYS2)

```
# In MSYS2 UCRT64 terminal
./scripts/setup-mingw.sh
./scripts/build-mingw.sh -t
```

1.2.3 Linux

```
./scripts/setup-linux.sh    # or --clang for Clang
./scripts/build-linux.sh -t
```

1.2.4 macOS

```
./scripts/setup-macos.sh
./scripts/build-macos.sh -t
```

1.3 Usage

1.3.1 Basic Encryption

```
# Encrypt with AES-256-GCM (default)
filevault encrypt secret.txt

# Decrypt
filevault decrypt secret.txt.fvlt

# With options
filevault encrypt data.zip -a chacha20-poly1305 -s paranoid --compression lzma
```

1.3.2 Mode Presets

```
filevault encrypt file.txt --mode basic      # AES-128-GCM, fast
filevault encrypt file.txt --mode standard    # AES-256-GCM, balanced
filevault encrypt file.txt --mode advanced    # ChaCha20-Poly1305, max security
```

1.3.3 Asymmetric Encryption

```
# Generate RSA key pair
filevault keygen --algorithm rsa-4096 --output mykey

# Encrypt with public key
filevault encrypt secret.txt --pubkey mykey.pub

# Decrypt with private key
filevault decrypt secret.txt.fvlt --privkey mykey.pem
```

1.3.4 Post-Quantum Cryptography (PQC)

```
# Generate Kyber keypair (quantum-resistant)
filevault keygen --algorithm kyber-1024 --output quantum-key

# Encrypt with Kyber-Hybrid (combines classical + PQC)
filevault encrypt secret.txt --algorithm kyber-1024-hybrid

# Generate Dilithium signing keypair
filevault keygen --algorithm dilithium-5 --output dilithium-key

# Hybrid encryption (recommended for quantum threat)
filevault encrypt data.zip -a kyber-1024-hybrid
```

1.3.5 Steganography

```
# Hide data in image
filevault stego embed message.txt cover.png -o hidden.png

# Extract hidden data
filevault stego extract hidden.png -o recovered.txt

# Check capacity
filevault stego capacity photo.jpg
```

1.3.6 Archive

```
# Create encrypted archive
filevault archive create documents/ -o backup.fva

# Extract archive
filevault archive extract backup.fva -o restored/

# List contents
filevault archive list backup.fva
```

1.3.7 Hash

```
filevault hash document.pdf          # SHA-256 (default)
filevault hash file.iso --algorithm blake2b   # BLAKE2b
filevault hash ./folder/ --recursive     # All files
```

1.3.8 Benchmark

```
filevault benchmark                  # All algorithms
filevault benchmark --algorithm aes-256-gcm # Specific
filevault benchmark --json -o results.json # Export
```

1.3.9 List & Info

```
filevault list algorithms    # Supported algorithms
filevault list kdfs          # Key derivation functions
filevault info encrypted.fvlt # File metadata
```

1.4 Building

1.4.1 Requirements

- C++20 compatible compiler
- CMake >= 3.20
- Conan 2.x
- Ninja (recommended)

1.4.2 Supported Platforms

Platform	Compiler	Status
Linux	GCC 13+	
Linux	Clang 17+	
Windows	MSVC 2022/2026	
Windows	MinGW GCC 14+	
macOS	Apple Clang 16+	

1.4.3 Manual Build

```
mkdir build && cd build
conan install .. --output-folder=. --build=missing
cmake --preset conan-release -DBUILD_TESTS=ON
cmake --build build/Release --parallel
```

See [docs/BUILD.md](#) for detailed instructions.

1.5 Algorithm Comparison

1.5.1 Symmetric (AEAD - Authenticated Encryption)

Algorithm	Key Size	Speed	Security	Use Case
AES-256-GCM	256-bit			General purpose
ChaCha20-Poly1305	256-bit			Mobile, no AES-NI
Serpent-256-GCM	256-bit			High security
Camellia-256-GCM	256-bit			Japan standard
ARIA-256-GCM	256-bit			Korea standard
SM4-GCM	128-bit			China standard

1.5.2 Asymmetric & Post-Quantum

Algorithm	Key Size	Type	Security	Quantum Resistant
RSA-4096	4096-bit	Classical		Vulnerable
ECC-P521	521-bit	Classical		Vulnerable
Kyber-512	N/A	PQC KEM		NIST Level 1
Kyber-768	N/A	PQC KEM		NIST Level 3
Kyber-1024	N/A	PQC KEM		NIST Level 5

Algorithm	Key Size	Type	Security	Quantum Resistant
KyberHybrid	Combined	PQC+AES		Defense in depth
Dilithium-5	N/A	PQC Signature		NIST Level 5

1.5.3 Key Derivation

KDF	Memory	Speed	Resistance
Argon2id	64MB+	Slow	GPU, ASIC
Scrypt	32MB+	Slow	GPU
PBKDF2	Minimal	Fast	Brute force only

1.5.4 Benchmark Results (1 MB data)

Symmetric Encryption:

- AES-256-GCM: ~700 MB/s (hardware accelerated)
- ChaCha20-Poly1305: ~600 MB/s (software optimized)
- Kyber-1024-Hybrid: ~650 MB/s (PQC + AES-GCM)

Asymmetric Operations:

- RSA-4096 Keygen: ~1.7 seconds
- ECC-P521 Keygen: ~10 ms
- Kyber-1024 Keygen: ~0.4 ms

PQC Performance:

- Kyber-1024 KEM Encapsulation: ~0.6 ms
- Kyber-1024 KEM Decapsulation: ~0.8 ms
- Dilithium-5 Sign: ~1.6 ms
- Dilithium-5 Verify: ~0.8 ms

1.6 Testing

```
# Run all tests
ctest --test-dir build --output-on-failure

# Run specific test
ctest --test-dir build -R "AES_GCM"

# With verbose output
ctest --test-dir build -V
```

1.6.1 Test Categories

- **Unit tests** - Individual components
- **Integration tests** - Full encrypt/decrypt flow
- **Security tests** -Nonce uniqueness, timing attacks
- **NIST vectors** - Standard test vectors

1.7 Project Structure

```
filevault/
include/filevault/      # Headers
algorithms/             # Crypto algorithms
cli/                    # CLI commands
core/                   # Core types & engine
utils/                  # Utilities
src/                    # Implementation
tests/                  # Test suites
scripts/                # Build scripts
docs/                  # Documentation
```

1.8 Configuration

1.8.1 Security Levels

Level	KDF Iterations	Memory	Description
weak	3	64MB	Fast, testing
medium	10	128MB	Balanced
strong	20	256MB	Recommended
paranoid	50	512MB	Maximum

1.8.2 Config File

```
filevault config set default-algorithm aes-256-gcm
filevault config set default-kdf argon2id
filevault config show
```

Chapter 3

Namespace Index

3.1 Namespace List

Here is a list of all namespaces with brief descriptions:

filevault	47
filevault::algorithms	47
filevault::algorithms::asymmetric	47
filevault::algorithms::classical	49
filevault::algorithms::pqc	49
filevault::algorithms::symmetric	50
filevault::archive	51
filevault::cli	52
filevault::cli::commands	52
filevault::compression	53
filevault::core	53
filevault::core::presets	61
filevault::format	62
filevault::steganography	62
filevault::utils	62

Chapter 4

Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

filevault::cli::Application	103
filevault::archive::ArchiveFormat	112
filevault::core::Argon2Params	116
filevault::cli::AsymmetricBenchmarkResult	123
filevault::cli::BenchmarkResult	135
filevault::utils::BlockProgressBar	136
filevault::core::ChunkInfo	155
filevault::compression::CompressionResult	162
filevault::compression::CompressionService	163
filevault::utils::Config	165
filevault::utils::Console	175
filevault::core::CryptoEngine	182
filevault::core::CryptoResult	188
filevault::utils::CryptoUtils	189
filevault::algorithms::pqc::Dilithium	199
filevault::algorithms::asymmetric::ECCKeyPair	211
filevault::algorithms::asymmetric::ECDH	212
filevault::algorithms::asymmetric::ECDHResult	214
filevault::algorithms::asymmetric::ECDSA	215
filevault::algorithms::asymmetric::ECDSASignResult	218
filevault::core::EncryptionConfig	224
filevault::archive::FileEntry	226
filevault::core::FileFormatHandler	228
filevault::core::FileHeader	232
filevault::format::FileHeader	235
filevault::cli::InfoCommand::FileInfo	246

filevault::cli::KeygenCommand	277
filevault::cli::ListCommand	294
filevault::cli::commands::ArchiveCommand	106

filevault::cli::commands::DumpCommand	203
filevault::cli::commands::KeyInfoCommand	281
filevault::cli::commands::SignCommand	340
filevault::cli::commands::StegoCommand	349
filevault::cli::commands::VerifyCommand	382
filevault::compression::ICompressor	267
filevault::compression::Bzip2Compressor	137
filevault::compression::LzmaCompressor	300
filevault::compression::ZlibCompressor	391
filevault::core::ICryptoAlgorithm	268
filevault::algorithms::asymmetric::ECCHybrid	206
filevault::algorithms::asymmetric::RSA	326
filevault::algorithms::classical::Caesar	138
filevault::algorithms::classical::Caesar	138
filevault::algorithms::classical::HillCipher	257
filevault::algorithms::classical::Playfair	313
filevault::algorithms::classical::Playfair	313
filevault::algorithms::classical::SubstitutionCipher	360
filevault::algorithms::classical::Vigenere	385
filevault::algorithms::classical::Vigenere	385
filevault::algorithms::pqc::Kyber	284
filevault::algorithms::pqc::KyberHybrid	289
filevault::algorithms::symmetric::AES_CBC	65
filevault::algorithms::symmetric::AES_CFB	70
filevault::algorithms::symmetric::AES_CTR	76
filevault::algorithms::symmetric::AES_ECB	80
filevault::algorithms::symmetric::AES_GCM	86
filevault::algorithms::symmetric::AES_OFB	92
filevault::algorithms::symmetric::AES_XTS	97
filevault::algorithms::symmetric::ARIA_GCM	117
filevault::algorithms::symmetric::Camellia_GCM	145
filevault::algorithms::symmetric::ChaCha20Poly1305	150
filevault::algorithms::symmetric::SM4_GCM	343
filevault::algorithms::symmetric::Serpent_GCM	334
filevault::algorithms::symmetric::TripleDES	371
filevault::algorithms::symmetric::Twofish_GCM	375
filevault::steganography::LSBSteganography	297
filevault::core::ModePreset	302
filevault::utils::Password	305
filevault::core::PasswordAnalysis	311
filevault::core::PBKDF2Params	312
filevault::cli::PQCBenchmarkResult	320
filevault::algorithms::pqc::PQKeyPair	321
filevault::utils::ProgressBar	321
filevault::core::Result< T >	323
filevault::core::Result< void >	325
filevault::algorithms::asymmetric::RSAKeyPair	332
filevault::core::ScryptParams	333
filevault::cli::SignatureBenchmarkResult	339
filevault::core::StreamingConfig	354
filevault::core::StreamingCrypto	355
filevault::core::StreamingResult	360
filevault::utils::TableBuilder	366
filevault::utils::TableFormatter	367

Chapter 5

Class Index

5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

filevault::algorithms::symmetric::AES_CBC	AES-CBC encryption (legacy mode, not authenticated)	65
filevault::algorithms::symmetric::AES_CFB	AES-CFB encryption algorithm	70
filevault::algorithms::symmetric::AES_CTR	AES-CTR encryption (stream cipher mode, not authenticated)	76
filevault::algorithms::symmetric::AES_ECB	AES-ECB encryption algorithm	80
filevault::algorithms::symmetric::AES_GCM	AES-GCM AEAD encryption	86
filevault::algorithms::symmetric::AES_OFB	AES-OFB encryption algorithm	92
filevault::algorithms::symmetric::AES_XTS	AES-XTS encryption algorithm	97
filevault::cli::Application	Main CLI application	103
filevault::cli::commands::ArchiveCommand	Archive command - compress and encrypt multiple files	106
filevault::archive::ArchiveFormat	Simple archive format handler	112
filevault::core::Argon2Params	KDF parameters for Argon2	116
filevault::algorithms::symmetric::ARIA_GCM	ARIA-GCM AEAD encryption	117
filevault::cli::AsymmetricBenchmarkResult		123
filevault::cli::BenchmarkCommand		124
filevault::cli::BenchmarkResult		135
filevault::utils::BlockProgressBar	Block-style progress bar	136
filevault::compression::Bzip2Compressor	BZIP2 compressor (better ratio, slower)	137
filevault::algorithms::classical::Caesar	Caesar Cipher - Educational only	138
filevault::algorithms::symmetric::Camellia_GCM	Camellia-GCM AEAD encryption	145
filevault::algorithms::symmetric::ChaCha20Poly1305	ChaCha20-Poly1305 AEAD encryption	150
filevault::core::ChunkInfo	Chunk information for streaming encryption	155

filevault::cli::CompressCommand	Compress command - standalone compression/decompression	156
filevault::compression::CompressionResult	Compression result	162
filevault::compression::CompressionService	Compression service - factory for compressors	163
filevault::utils::Config	Configuration manager for FileVault	165
filevault::cli::ConfigCommand	Config command - manage FileVault configuration	170
filevault::utils::Console	Console utilities for colored output	175
filevault::core::CryptoEngine	Main cryptographic engine Manages algorithms and provides key derivation	182
filevault::core::CryptoResult	Result of cryptographic operations	188
filevault::utils::CryptoUtils	Crypto utility functions	189
filevault::cli::DecompressCommand	Decompress command - alias for compress -d	190
filevault::cli::DecryptCommand		195
filevault::algorithms::pqc::Dilithium	Dilithium Digital Signature Algorithm	199
filevault::cli::commands::DumpCommand	Command to dump file content in various formats (hex, binary, base64)	203
filevault::algorithms::asymmetric::ECCHybrid	Hybrid encryption using ECDH + AES-GCM	206
filevault::algorithms::asymmetric::ECCKeyPair	ECC key pair (ECDH or ECDSA)	211
filevault::algorithms::asymmetric::ECDH	Elliptic Curve Diffie-Hellman (ECDH) key exchange	212
filevault::algorithms::asymmetric::ECDHResult	ECDH Key Exchange result	214
filevault::algorithms::asymmetric::ECDSA	Elliptic Curve Digital Signature Algorithm (ECDSA)	215
filevault::algorithms::asymmetric::ECDSASignResult	ECDSA signature result	218
filevault::cli::EncryptCommand	Encrypt command	218
filevault::core::EncryptionConfig	Configuration for encryption operations	224
filevault::archive::FileEntry	Archive file entry metadata	226
filevault::core::FileFormatHandler	File format handler	228
filevault::core::FileHeader	File format header	232
filevault::format::FileHeader	FileVault encrypted file format	235
filevault::cli::InfoCommand::FileInfo	Parse encrypted file header	246
filevault::utils::FileIO	File I/O utilities	247
filevault::cli::HashCommand	Hash command - Calculate cryptographic hashes	250
filevault::core::HashConfig	Configuration for hashing operations	256

filevault::algorithms::classical::HillCipher	257
Hill cipher (2x2 matrix)	257
filevault::cli:: ICommand	264
Base interface for CLI commands	264
filevault::compression::ICompressor	267
Interface for compression algorithms	267
filevault::core::ICryptoAlgorithm	268
Interface for cryptographic algorithms	268
filevault::cli::InfoCommand	272
Info command - display encrypted file metadata	272
filevault::cli::KeygenCommand	277
Command to generate key pairs for asymmetric encryption	277
filevault::cli::commands::KeyInfoCommand	281
Command to display information about cryptographic keys	281
filevault::algorithms::pqc::Kyber	284
Kyber Key Encapsulation Mechanism (KEM)	284
filevault::algorithms::pqc::KyberHybrid	289
Hybrid encryption combining Kyber with AES-GCM	289
filevault::cli::ListCommand	294
filevault::steganography::LSBSteganography	297
LSB (Least Significant Bit) Steganography	297
filevault::compression::LzmaCompressor	300
LZMA compressor (maximum compression, slowest)	300
filevault::core::ModePreset	302
Mode presets for different user levels	302
filevault::utils::Password	305
Password utilities for secure input and strength analysis	305
filevault::core::PasswordAnalysis	311
Password strength analysis result	311
filevault::core::PBKDF2Params	312
KDF parameters for PBKDF2	312
filevault::algorithms::classical::Playfair	313
Playfair Cipher - Digraph substitution	313
filevault::cli::PQCBenchmarkResult	320
filevault::algorithms::pqc::PQKeyPair	321
Key pair for post-quantum algorithms	321
filevault::utils::ProgressBar	321
Modern progress bar wrapper	321
filevault::core::Result< T >	323
Generic result type	323
filevault::core::Result< void >	325
Specialization for void	325
filevault::algorithms::asymmetric::RSA	326
RSA asymmetric encryption algorithm	326
filevault::algorithms::asymmetric::RSAKeyPair	332
RSA key pair	332
filevault::core::ScryptParams	333
KDF parameters for Scrypt	333
filevault::algorithms::symmetric::Serpent_GCM	334
Serpent-256-GCM implementation	334
filevault::cli::SignatureBenchmarkResult	339
filevault::cli::commands::SignCommand	340
Command to create digital signature for a file	340
filevault::algorithms::symmetric::SM4_GCM	343
SM4-GCM AEAD encryption	343
filevault::cli::commands::StegoCommand	349
Steganography command for embedding/extracting data in images	349

<code>filevault::core::StreamingConfig</code>	Configuration for streaming encryption	354
<code>filevault::core::StreamingCrypto</code>	Streaming encryption/decryption for large files	355
<code>filevault::core::StreamingResult</code>	<code>Result</code> of streaming operation	360
<code>filevault::algorithms::classical::SubstitutionCipher</code>	Simple substitution cipher	360
<code>filevault::utils::TableBuilder</code>	Quick table builders	366
<code>filevault::utils::TableFormatter</code>	Beautiful table formatter	367
<code>filevault::algorithms::symmetric::TripleDES</code>	Triple-DES (3DES/TDEA) encryption	371
<code>filevault::algorithms::symmetric::Twofish_GCM</code>	Twofish-256-GCM implementation	375
<code>filevault::cli::commands::VerifyCommand</code>	Command to verify digital signature of a file	382
<code>filevault::algorithms::classical::Vigenere</code>	Vigenre Cipher - Polyalphabetic substitution	385
<code>filevault::compression::ZlibCompressor</code>	ZLIB compressor (fast, good compression)	391

Chapter 6

File Index

6.1 File List

Here is a list of all files with brief descriptions:

include/filevault/algorithms/asymmetric/ ecc.hpp	Elliptic Curve Cryptography (ECC) implementation	395
include/filevault/algorithms/asymmetric/ rsa.hpp	RSA asymmetric encryption	398
include/filevault/algorithms/classical/ caesar.hpp	Caesar cipher	400
include/filevault/algorithms/classical/ classical_ciphers.hpp	Classical ciphers	401
include/filevault/algorithms/classical/ hill.hpp	Hill cipher	403
include/filevault/algorithms/classical/ playfair.hpp	Playfair cipher	405
include/filevault/algorithms/classical/ substitution.hpp	Substitution cipher	407
include/filevault/algorithms/classical/ vigenere.hpp	Vigenère cipher	409
include/filevault/algorithms/pqc/ post_quantum.hpp	Post-Quantum Cryptography	411
include/filevault/algorithms/symmetric/ aes_cbc.hpp	AES-CBC encryption implementation	414
include/filevault/algorithms/symmetric/ aes_cfb.hpp	AES-CFB (Cipher Feedback) mode encryption	416
include/filevault/algorithms/symmetric/ aes_ctr.hpp	AES-CTR (Counter mode) encryption implementation	418
include/filevault/algorithms/symmetric/ aes_ecb.hpp	AES-ECB (Electronic Codebook) mode encryption	420
include/filevault/algorithms/symmetric/ aes_gcm.hpp	AES-GCM AEAD encryption algorithm	422
include/filevault/algorithms/symmetric/ aes_ofb.hpp	AES-OFB (Output Feedback) mode encryption	424
include/filevault/algorithms/symmetric/ aes_xts.hpp	AES-XTS (XEX-based Tweaked-codebook mode with ciphertext Stealing)	426
include/filevault/algorithms/symmetric/ aria_gcm.hpp	ARIA-GCM AEAD encryption algorithm	428
include/filevault/algorithms/symmetric/ camellia_gcm.hpp	Camellia-GCM AEAD encryption algorithm	430
include/filevault/algorithms/symmetric/ chacha20_poly1305.hpp	ChaCha20-Poly1305 AEAD encryption algorithm	432
include/filevault/algorithms/symmetric/ serpent_gcm.hpp	Serpent-GCM AEAD encryption algorithm	434
include/filevault/algorithms/symmetric/ sm4_gcm.hpp	SM4-GCM AEAD encryption algorithm	436
include/filevault/archives/ archive_format.hpp	Archive file format	442
include/filevault/cli/ app.hpp	CLI application	444
include/filevault/cli/ command.hpp	CLI command	446
include/filevault/cli/commands/ archive_cmd.hpp	CLI archive command	447

include/filevault/cli/commands/benchmark_cmd.hpp	449
include/filevault/cli/commands/compress_cmd.hpp	451
include/filevault/cli/commands/config_cmd.hpp	453
include/filevault/cli/commands/decompress_cmd.hpp	454
include/filevault/cli/commands/decrypt_cmd.hpp	456
include/filevault/cli/commands/dump_cmd.hpp	457
include/filevault/cli/commands/encrypt_cmd.hpp	459
include/filevault/cli/commands/hash_cmd.hpp	460
include/filevault/cli/commands/info_cmd.hpp	462
include/filevault/cli/commands/keygen_cmd.hpp Key generation command for asymmetric encryption	464
include/filevault/cli/commands/keyinfo_cmd.hpp	466
include/filevault/cli/commands/list_cmd.hpp	467
include/filevault/cli/commands/sign_cmd.hpp	468
include/filevault/cli/commands/stego_cmd.hpp	470
include/filevault/cli/commands/verify_cmd.hpp	472
include/filevault/compression/compressor.hpp	473
include/filevault/core/crypto_algorithm.hpp	475
include/filevault/core/crypto_engine.hpp	477
include/filevault/core/file_format.hpp	478
include/filevault/core/modes.hpp	482
include/filevault/core/result.hpp	484
include/filevault/core/streaming.hpp	486
include/filevault/core/types.hpp	488
include/filevault/format/file_header.hpp	493
include/filevault/steganography/lsb.hpp	495
include/filevault/utils/config.hpp	497
include/filevault/utils/console.hpp	499
include/filevault/utils/crypto_utils.hpp	500
include/filevault/utils/file_io.hpp	501
include/filevault/utils/password.hpp	502
include/filevault/utils/progress.hpp	503
include/filevault/utils/table_formatter.hpp	505
src/main.cpp	539
src/algorithms/asymmetric/ecc.cpp Elliptic Curve Cryptography implementation	506
src/algorithms/asymmetric/rsa.cpp RSA asymmetric encryption implementation	507
src/algorithms/classical/caesar.cpp	508
src/algorithms/classical/classical_ciphers.hpp	509
src/algorithms/classical/hill.hpp	509
src/algorithms/classical/playfair.hpp	510
src/algorithms/classical/substitution.hpp	511
src/algorithms/classical/vigenere.hpp	512
src/algorithms/pqc/post_quantum.cpp Post-Quantum Cryptography implementations using Botan 3.x	513
src/algorithms/symmetric/aes_cbc.cpp AES-CBC encryption implementation	514
src/algorithms/symmetric/aes_cfb.cpp AES-CFB encryption implementation	515
src/algorithms/symmetric/aes_ctr.cpp AES-CTR encryption implementation	515
src/algorithms/symmetric/aes_ecb.cpp AES-ECB encryption implementation	516
src/algorithms/symmetric/aes_gcm.cpp	517
src/algorithms/symmetric/aes_ofb.cpp AES-OFB encryption implementation	517

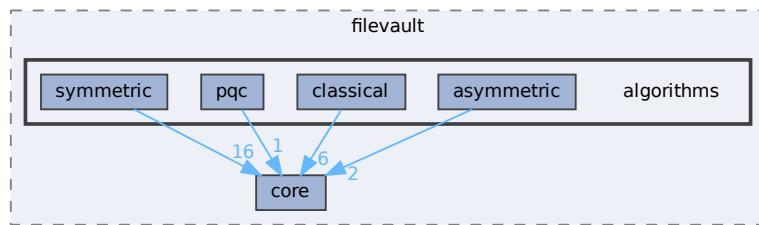

src/algorithms/symmetric/ aes_xts.cpp	518
AES-XTS encryption implementation for disk encryption	
src/algorithms/symmetric/ aria_gcm.cpp	519
Implementation of ARIA-GCM AEAD encryption	
src/algorithms/symmetric/ camellia_gcm.cpp	520
Implementation of Camellia-GCM AEAD encryption	
src/algorithms/symmetric/ chacha20_poly1305.cpp	521
src/algorithms/symmetric/ serpent_gcm.cpp	522
src/algorithms/symmetric/ sm4_gcm.cpp	522
Implementation of SM4-GCM AEAD encryption	
src/algorithms/symmetric/ triple_des.cpp	523
Triple-DES (3DES) encryption implementation	
src/archive/ archive_format.cpp	524
src/cli/ app.cpp	524
src/cli/commands/ archive_cmd.cpp	525
src/cli/commands/ benchmark_cmd.cpp	526
Enhanced benchmark command with all algorithms and tabulate tables	
src/cli/commands/ compress_cmd.cpp	526
src/cli/commands/ config_cmd.cpp	527
src/cli/commands/ decompress_cmd.cpp	527
src/cli/commands/ decrypt_cmd.cpp	528
src/cli/commands/ dump_cmd.cpp	528
src/cli/commands/ encrypt_cmd.cpp	529
src/cli/commands/ hash_cmd.cpp	529
src/cli/commands/ info_cmd.cpp	530
src/cli/commands/ keygen_cmd.cpp	531
Key generation command implementation	
src/cli/commands/ keyinfo_cmd.cpp	531
src/cli/commands/ list_cmd.cpp	532
src/cli/commands/ sign_cmd.cpp	532
src/cli/commands/ stego_cmd.cpp	533
src/cli/commands/ verify_cmd.cpp	533
src/compression/ compressor.cpp	535
src/core/ crypto_engine.cpp	535
src/core/ modes.cpp	536
src/core/ streaming.cpp	536
Streaming encryption implementation for large files	
src/core/ types.cpp	537
src/format/ file_format.cpp	538
src/format/ file_header.cpp	538
src/steganography/ lsb.cpp	539

Chapter 7

Directory Documentation

7.1 include/filevault/algorithms Directory Reference

Directory dependency graph for algorithms:

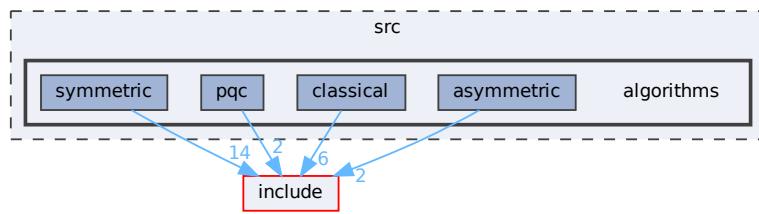

Directories

- directory [asymmetric](#)
- directory [classical](#)
- directory [pqc](#)
- directory [symmetric](#)

7.2 src/algorithms Directory Reference

Directory dependency graph for algorithms:

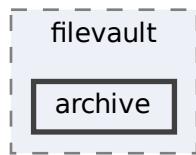

Directories

- directory [asymmetric](#)
- directory [classical](#)
- directory [pqc](#)
- directory [symmetric](#)

7.3 include/filevault/archive Directory Reference

Directory dependency graph for archive:

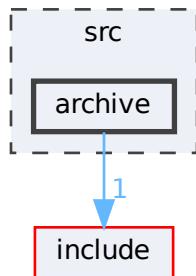

Files

- file [archive_format.hpp](#)

7.4 src/archive Directory Reference

Directory dependency graph for archive:

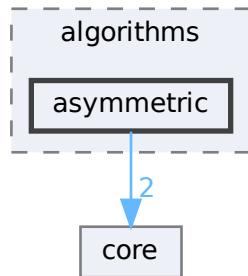

Files

- file [archive_format.cpp](#)

7.5 include/filevault/algorithms/asymmetric Directory Reference

Directory dependency graph for asymmetric:

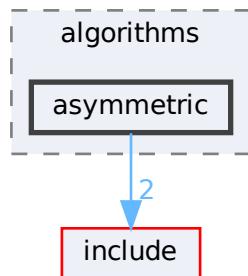

Files

- file [ecc.hpp](#)
Elliptic Curve Cryptography (ECC) implementation.
- file [rsa.hpp](#)
RSA asymmetric encryption.

7.6 src/algorithms/asymmetric Directory Reference

Directory dependency graph for asymmetric:

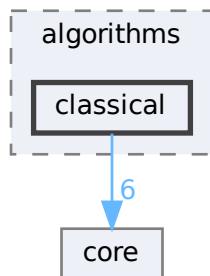

Files

- file [ecc.cpp](#)
Elliptic Curve Cryptography implementation.
- file [rsa.cpp](#)
RSA asymmetric encryption implementation.

7.7 include/filevault/algorithms/classical Directory Reference

Directory dependency graph for classical:

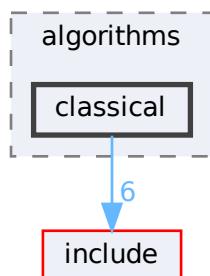

Files

- file [caesar.hpp](#)
- file [classical_ciphers.hpp](#)
- file [hill.hpp](#)
- file [playfair.hpp](#)
- file [substitution.hpp](#)
- file [vigenere.hpp](#)

7.8 src/algorithms/classical Directory Reference

Directory dependency graph for classical:

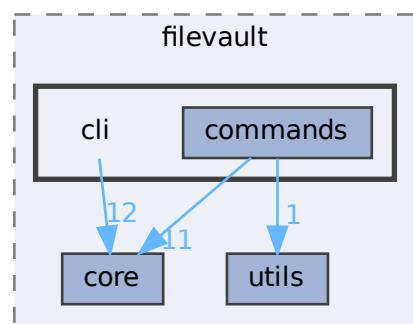

Files

- file [caesar.cpp](#)
- file [classical_ciphers.cpp](#)
- file [hill.cpp](#)

- file [playfair.cpp](#)
- file [substitution.cpp](#)
- file [vigenere.cpp](#)

7.9 include/filevault/cli Directory Reference

Directory dependency graph for cli:

Directories

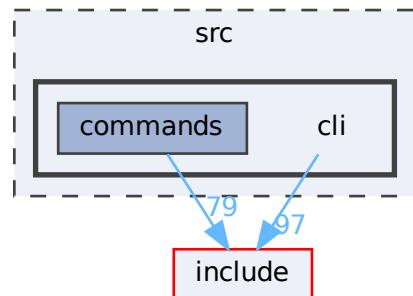

- directory [commands](#)

Files

- file [app.hpp](#)
- file [command.hpp](#)

7.10 src/cli Directory Reference

Directory dependency graph for cli:

Directories

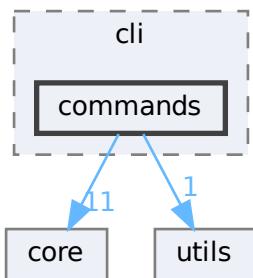

- directory [commands](#)

Files

- file [app.cpp](#)

7.11 include/filevault/cli/commands Directory Reference

Directory dependency graph for commands:

Files

- file [archive_cmd.hpp](#)
- file [benchmark_cmd.hpp](#)
- file [compress_cmd.hpp](#)
- file [config_cmd.hpp](#)

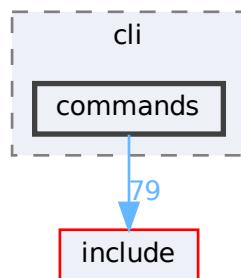

- file [decompress_cmd.hpp](#)
- file [decrypt_cmd.hpp](#)
- file [dump_cmd.hpp](#)
- file [encrypt_cmd.hpp](#)
- file [hash_cmd.hpp](#)
- file [info_cmd.hpp](#)
- file [keygen_cmd.hpp](#)

Key generation command for asymmetric encryption.

- file [keyinfo_cmd.hpp](#)
- file [list_cmd.hpp](#)
- file [sign_cmd.hpp](#)
- file [stego_cmd.hpp](#)
- file [verify_cmd.hpp](#)

7.12 src/cli/commands Directory Reference

Directory dependency graph for commands:

Files

- file [archive_cmd.cpp](#)
- file [benchmark_cmd.cpp](#)

Enhanced benchmark command with all algorithms and tabulate tables.

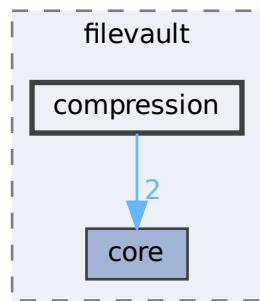

- file [compress_cmd.cpp](#)
- file [config_cmd.cpp](#)
- file [decompress_cmd.cpp](#)
- file [decrypt_cmd.cpp](#)
- file [dump_cmd.cpp](#)
- file [encrypt_cmd.cpp](#)
- file [hash_cmd.cpp](#)
- file [info_cmd.cpp](#)
- file [keygen_cmd.cpp](#)

Key generation command implementation.

- file [keyinfo_cmd.cpp](#)
- file [list_cmd.cpp](#)
- file [sign_cmd.cpp](#)
- file [stego_cmd.cpp](#)
- file [verify_cmd.cpp](#)

7.13 include/filevault/compression Directory Reference

Directory dependency graph for compression:

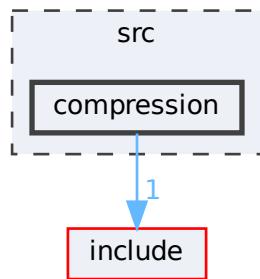

Files

- file [compressor.hpp](#)

7.14 src/compression Directory Reference

Directory dependency graph for compression:

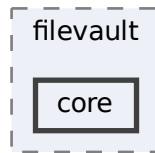

Files

- file [compressor.cpp](#)

7.15 include/filevault/core Directory Reference

Directory dependency graph for core:

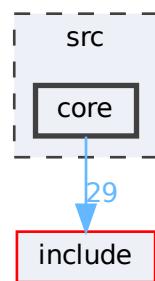

Files

- file [crypto_algorithm.hpp](#)
- file [crypto_engine.hpp](#)
- file [file_format.hpp](#)
- file [modes.hpp](#)
- file [result.hpp](#)
- file [streaming.hpp](#)
- file [types.hpp](#)

7.16 src/core Directory Reference

Directory dependency graph for core:

Files

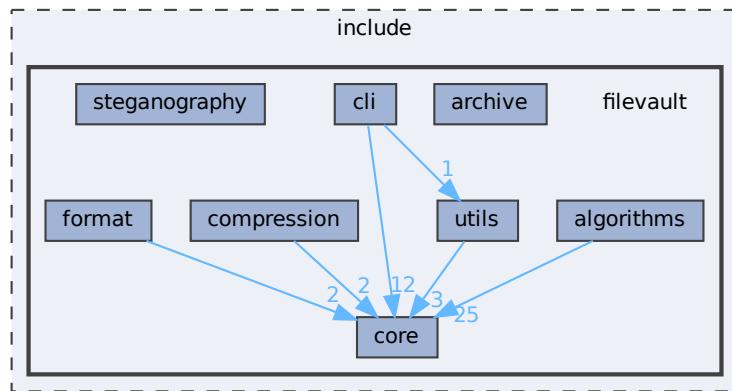

- file [crypto_engine.cpp](#)
- file [modes.cpp](#)
- file [streaming.cpp](#)

Streaming encryption implementation for large files.

- file [types.cpp](#)

7.17 include/filevault Directory Reference

Directory dependency graph for filevault:

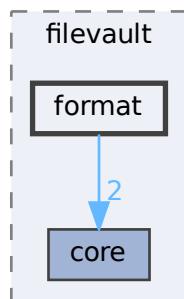

Directories

- directory [algorithms](#)
- directory [archive](#)
- directory [cli](#)
- directory [compression](#)
- directory [core](#)
- directory [format](#)
- directory [steganography](#)
- directory [utils](#)

7.18 include/filevault/format Directory Reference

Directory dependency graph for format:

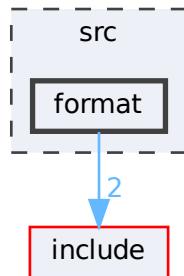

Files

- file [file_header.hpp](#)

7.19 src/format Directory Reference

Directory dependency graph for format:

**Files**

- file [file_format.cpp](#)
- file [file_header.cpp](#)

7.20 include Directory Reference

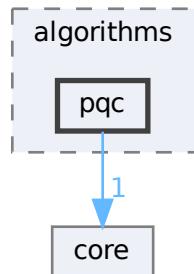

Directory dependency graph for include:

**Directories**

- directory [filevault](#)

7.21 include/filevault/algorithms/pqc Directory Reference

Directory dependency graph for pqc:

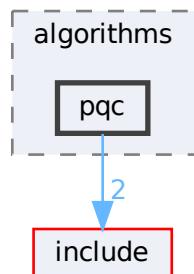

Files

- file [post_quantum.hpp](#)

7.22 src/algorithms/pqc Directory Reference

Directory dependency graph for pqc:

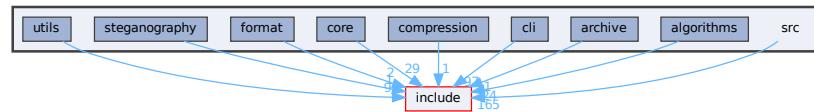

Files

- file [post_quantum.cpp](#)

Post-Quantum Cryptography implementations using Botan 3.x.

7.23 src Directory Reference

Directory dependency graph for src:

Directories

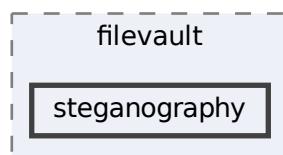

- directory [algorithms](#)
- directory [archive](#)
- directory [cli](#)
- directory [compression](#)
- directory [core](#)
- directory [format](#)
- directory [steganography](#)
- directory [utils](#)

Files

- file [main.cpp](#)

7.24 include/filevault/steganography Directory Reference

Directory dependency graph for steganography:

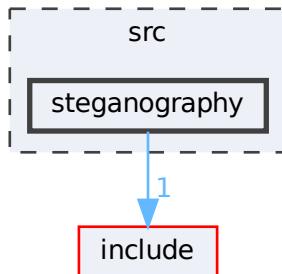

Files

- file [lsb.hpp](#)

7.25 src/steganography Directory Reference

Directory dependency graph for steganography:

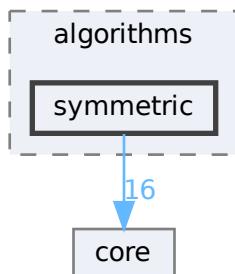

Files

- file [lsb.cpp](#)

7.26 include/filevault/algorithms/symmetric Directory Reference

Directory dependency graph for symmetric:

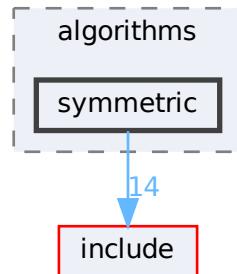

Files

- file [aes_cbc.hpp](#)
AES-CBC encryption implementation.
- file [aes_cfb.hpp](#)
AES-CFB (Cipher Feedback) mode encryption.
- file [aes_ctr.hpp](#)
AES-CTR (Counter mode) encryption implementation.
- file [aes_ecb.hpp](#)

- file [aes_ecb.hpp](#)
AES-ECB (Electronic Codebook) mode encryption.
- file [aes_ofb.hpp](#)
- file [aes_ofb.hpp](#)
AES-OFB (Output Feedback) mode encryption.
- file [aes_xts.hpp](#)
AES-XTS (XEX-based Tweaked-codebook mode with ciphertext Stealing).
- file [aria_gcm.hpp](#)
ARIA-GCM AEAD encryption algorithm.
- file [camellia_gcm.hpp](#)
Camellia-GCM AEAD encryption algorithm.
- file [chacha20_poly1305.hpp](#)
- file [serpent_gcm.hpp](#)
- file [sm4_gcm.hpp](#)
SM4-GCM AEAD encryption algorithm.
- file [triple_des.hpp](#)
Triple-DES (3DES) encryption implementation.
- file [twofish_gcm.hpp](#)
Twofish-256-GCM encryption algorithm.

7.27 src/algorithms/symmetric Directory Reference

Directory dependency graph for symmetric:

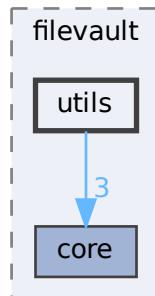

Files

- file [aes_cbc.cpp](#)
AES-CBC encryption implementation.
- file [aes_cfb.cpp](#)
AES-CFB encryption implementation.
- file [aes_ctr.cpp](#)
AES-CTR encryption implementation.
- file [aes_ecb.cpp](#)
AES-ECB encryption implementation.
- file [aes_gcm.cpp](#)
- file [aes_ofb.cpp](#)
AES-OFB encryption implementation.

- file [aes_xts.cpp](#)
AES-XTS encryption implementation for disk encryption.
- file [aria_gcm.cpp](#)
Implementation of ARIA-GCM AEAD encryption.
- file [camellia_gcm.cpp](#)
Implementation of Camellia-GCM AEAD encryption.
- file [chacha20_poly1305.cpp](#)
- file [serpent_gcm.cpp](#)
- file [sm4_gcm.cpp](#)
Implementation of SM4-GCM AEAD encryption.
- file [triple_des.cpp](#)
Triple-DES (3DES) encryption implementation.
- file [twofish_gcm.cpp](#)
Twofish-GCM encryption implementation.

7.28 include/filevault/utils Directory Reference

Directory dependency graph for utils:

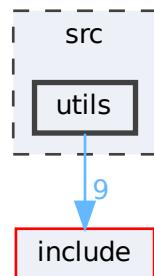

Files

- file [config.hpp](#)
- file [console.hpp](#)
- file [crypto_utils.hpp](#)
- file [file_io.hpp](#)
- file [password.hpp](#)
- file [progress.hpp](#)
- file [table_formatter.hpp](#)

7.29 src/utils Directory Reference

Directory dependency graph for utils:

Files

- file [config.cpp](#)
- file [console.cpp](#)
- file [crypto_utils.cpp](#)
- file [file_io.cpp](#)
- file [password.cpp](#)
- file [progress.cpp](#)
- file [table_formatter.cpp](#)

8.3 filevault::algorithms::asymmetric Namespace Reference

Classes

- struct [ECCKeyPair](#)
ECC key pair ([ECDH](#) or [ECDSA](#)).
- struct [ECDHResult](#)
ECDH Key Exchange result.
- struct [ECDSASignResult](#)
ECDSA signature result.
- class [ECDH](#)
Elliptic Curve Diffie-Hellman ([ECDH](#)) key exchange.
- class [ECDSA](#)
Elliptic Curve Digital Signature Algorithm ([ECDSA](#)).
- class [ECCHybrid](#)
Hybrid encryption using [ECDH](#) + AES-GCM.
- struct [RSAKeyPair](#)
RSA key pair.

- class [RSA](#)

RSA asymmetric encryption algorithm.

Enumerations

- enum class [ECCurve](#) { [SECP256R1](#) , [SECP384R1](#) , [SECP521R1](#) , [X25519](#) }
- Supported elliptic curves.*

Functions

- static std::string [get_botan_curve_name](#) ([ECCurve](#) curve)
- static size_t [get_curve_key_size](#) ([ECCurve](#) curve)

8.3.1 Enumeration Type Documentation

8.3.1.1 [ECCurve](#)

enum class [filevault::algorithms::asymmetric::ECCurve](#) [strong]
 Supported elliptic curves.

Enumerator

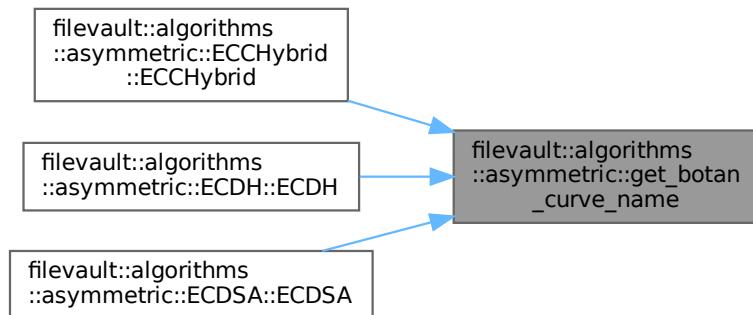

SECP256R1	
SECP384R1	
SECP521R1	
X25519	

8.3.2 Function Documentation

8.3.2.1 [get_botan_curve_name\(\)](#)

```
std::string filevault::algorithms::asymmetric::get_botan_curve_name (
    ECCurve curve) [static]
```

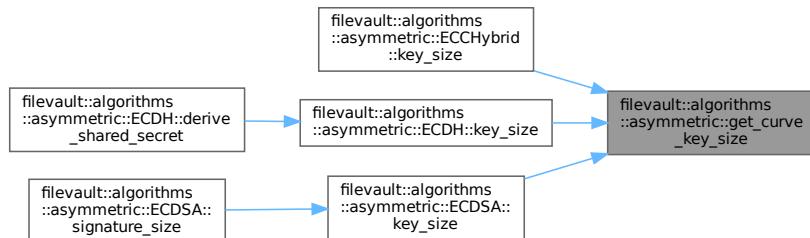

Here is the caller graph for this function:

8.3.2.2 get_curve_key_size()

```
size_t filevault::algorithms::asymmetric::get_curve_key_size (
    ECCurve curve) [static]
```

Here is the caller graph for this function:

8.4 filevault::algorithms::classical Namespace Reference

Classes

- class [Caesar](#)
Caesar Cipher - Educational only.
- class [Vigenere](#)
Vigenere Cipher - Polyalphabetic substitution.
- class [Playfair](#)
Playfair Cipher - Digraph substitution.
- class [HillCipher](#)
Hill cipher (2x2 matrix).
- class [SubstitutionCipher](#)
Simple substitution cipher.

8.5 filevault::algorithms::pqc Namespace Reference

Classes

- struct [PQKeyPair](#)
Key pair for post-quantum algorithms.
- class [Kyber](#)
Kyber Key Encapsulation Mechanism (KEM).
- class [Dilithium](#)
Dilithium Digital Signature Algorithm.
- class [KyberHybrid](#)
Hybrid encryption combining [Kyber](#) with AES-GCM.

Functions

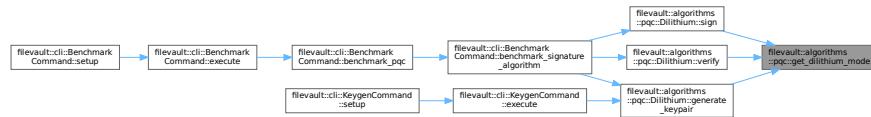

- static Botan::KyberMode [get_kyber_mode](#) ([Kyber::Variant](#) variant)
- static Botan::DilithiumMode [get_dilithium_mode](#) ([Dilithium::Variant](#) variant)

8.5.1 Function Documentation

8.5.1.1 get_dilithium_mode()

```
Botan::DilithiumMode filevault::algorithms::pqc::get_dilithium_mode (
    Dilithium::Variant variant) [static]
```

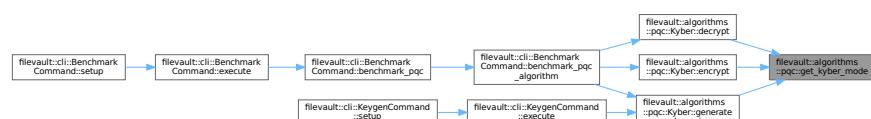

Here is the caller graph for this function:

8.5.1.2 get_kyber_mode()

```
Botan::KyberMode filevault::algorithms::pqc::get_kyber_mode (
    Kyber::Variant variant) [static]
```

Here is the caller graph for this function:

8.6 filevault::algorithms::symmetric Namespace Reference

Classes

- class [AES_CBC](#)
AES-CBC encryption (legacy mode, not authenticated).
- class [AES_CFB](#)
AES-CFB encryption algorithm.
- class [AES_CTR](#)
AES-CTR encryption (stream cipher mode, not authenticated).
- class [AES_ECB](#)
AES-ECB encryption algorithm.
- class [AES_GCM](#)
AES-GCM AEAD encryption.
- class [AES_OFB](#)
AES-OFB encryption algorithm.
- class [AES_XTS](#)
AES-XTS encryption algorithm.
- class [ARIA_GCM](#)
ARIA-GCM AEAD encryption.
- class [Camellia_GCM](#)
Camellia-GCM AEAD encryption.
- class [ChaCha20Poly1305](#)
ChaCha20-Poly1305 AEAD encryption.
- class [Serpent_GCM](#)

- class [SM4_GCM](#)
SM4-GCM AEAD encryption.
- class [TripleDES](#)
Triple-DES (3DES/TDEA) encryption.
- class [Twofish_GCM](#)
Twofish-256-GCM implementation.

Functions

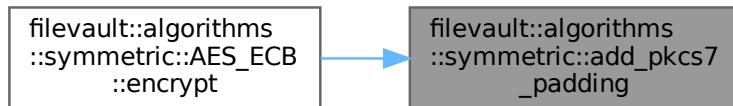

- static std::vector< uint8_t > [add_pkcs7_padding](#) (std::span< const uint8_t > data, size_t block_size)
- static std::vector< uint8_t > [remove_pkcs7_padding](#) (std::span< const uint8_t > data)

8.6.1 Function Documentation

8.6.1.1 [add_pkcs7_padding\(\)](#)

```
std::vector< uint8_t > filevault::algorithms::symmetric::add_pkcs7_padding (
    std::span< const uint8_t > data,
    size_t block_size) [static]
```

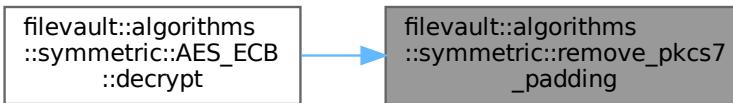

Here is the caller graph for this function:

8.6.1.2 [remove_pkcs7_padding\(\)](#)

```
std::vector< uint8_t > filevault::algorithms::symmetric::remove_pkcs7_padding (
    std::span< const uint8_t > data) [static]
```

Here is the caller graph for this function:

8.7 filevault::archive Namespace Reference

Classes

- struct [FileEntry](#)

- class [ArchiveFormat](#)
Simple archive format handler.

8.8 filevault::cli Namespace Reference

Namespaces

- namespace [commands](#)

Classes

- class [Application](#)
Main CLI application.
- class [ICommand](#)
Base interface for CLI commands.
- struct [BenchmarkResult](#)
- struct [AsymmetricBenchmarkResult](#)
- struct [PQCBenchmarkResult](#)
- struct [SignatureBenchmarkResult](#)
- class [BenchmarkCommand](#)
- class [CompressCommand](#)
Compress command - standalone compression/decompression.
- class [ConfigCommand](#)
Config command - manage FileVault configuration.
- class [DecompressCommand](#)
Decompress command - alias for compress -d.
- class [DecryptCommand](#)
- class [EncryptCommand](#)
Encrypt command.
- class [HashCommand](#)
Hash command - Calculate cryptographic hashes.
- class [InfoCommand](#)
Info command - display encrypted file metadata.
- class [KeygenCommand](#)
Command to generate key pairs for asymmetric encryption.
- class [ListCommand](#)

8.9 filevault::cli::commands Namespace Reference

Classes

- class [ArchiveCommand](#)
Archive command - compress and encrypt multiple files.
- class [DumpCommand](#)
Command to dump file content in various formats (hex, binary, base64).
- class [KeyInfoCommand](#)
Command to display information about cryptographic keys.
- class [SignCommand](#)
Command to create digital signature for a file.
- class [StegoCommand](#)
Steganography command for embedding/extracting data in images.
- class [VerifyCommand](#)
Command to verify digital signature of a file.

8.10 filevault::compression Namespace Reference

Classes

- struct [CompressionResult](#)
Compression result.
- class [ICompressor](#)
Interface for compression algorithms.
- class [CompressionService](#)
Compression service - factory for compressors.
- class [ZlibCompressor](#)
ZLIB compressor (fast, good compression).
- class [Bzip2Compressor](#)
BZIP2 compressor (better ratio, slower).
- class [LzmaCompressor](#)
LZMA compressor (maximum compression, slowest).

8.11 filevault::core Namespace Reference

Namespaces

- namespace [presets](#)

Classes

- class [ICryptoAlgorithm](#)
Interface for cryptographic algorithms.
- class [CryptoEngine](#)
Main cryptographic engine Manages algorithms and provides key derivation.
- struct [Argon2Params](#)
KDF parameters for Argon2.
- struct [PBKDF2Params](#)
KDF parameters for PBKDF2.
- struct [ScryptParams](#)
KDF parameters for Scrypt.
- struct [FileHeader](#)
File format header.
- class [FileFormatHandler](#)
File format handler.
- struct [ModePreset](#)
Mode presets for different user levels.
- struct [CryptoResult](#)
Result of cryptographic operations.
- struct [Result](#)
Generic result type.
- struct [Result< void >](#)
Specialization for void.
- struct [ChunkInfo](#)
Chunk information for streaming encryption.
- struct [StreamingConfig](#)
Configuration for streaming encryption.
- struct [StreamingResult](#)
Result of streaming operation.

- class [StreamingCrypto](#)
Streaming encryption/decryption for large files.
- struct [EncryptionConfig](#)
Configuration for encryption operations.
- struct [HashConfig](#)
Configuration for hashing operations.
- struct [PasswordAnalysis](#)
Password strength analysis result.

Typedefs

- using [StreamProgressCallback](#) = std::function<bool(const [ChunkInfo](#)& info)>
Progress callback for streaming operations.

Enumerations

- enum class [AlgorithmID](#) : uint8_t {

9.1.1 Detailed Description

AES-CBC encryption (legacy mode, not authenticated).

Supports 128, 192, and 256 bit keys. Uses PKCS7 padding. Requires unique IV for each encryption.

Warning

This mode does NOT provide authentication! Ciphertext can be modified without detection. Consider using AES-GCM for authenticated encryption.

9.1.2 Constructor & Destructor Documentation

9.1.2.1 AES_CBC()

```
filevault::algorithms::symmetric::AES_CBC::AES_CBC (
    size_t key_bits = 256) [explicit]
```

9.1.2.2 ~AES_CBC()

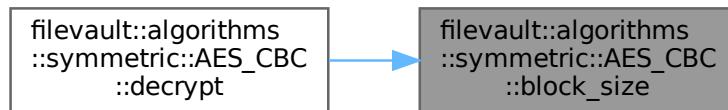

```
virtual filevault::algorithms::symmetric::AES_CBC::~AES_CBC () [virtual], [default]
```

9.1.3 Member Function Documentation

9.1.3.1 block_size()

```
size_t filevault::algorithms::symmetric::AES_CBC::block_size () const [inline]
```

Here is the caller graph for this function:

9.1.3.2 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::AES_CBC::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

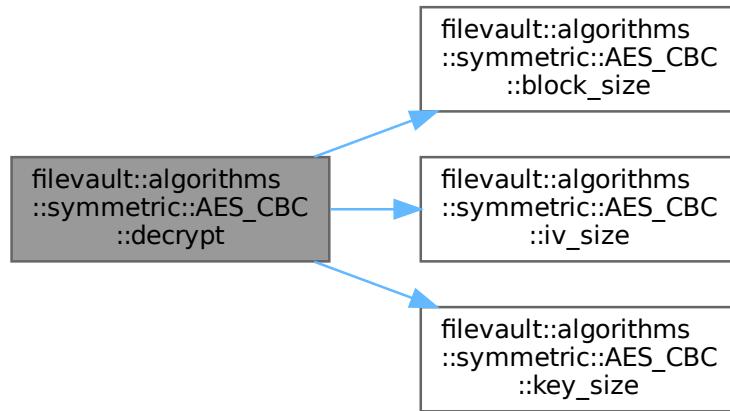

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.1.3.3 encrypt()

```
core::CryptoResult filevault::algorithms::symmetric::AES_CBC::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

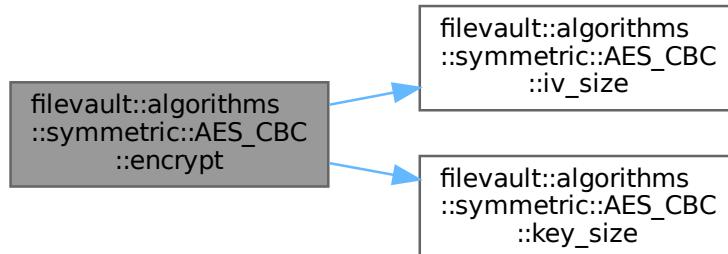

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.1.3.4 is_suitable_for()**

```
bool filevault::algorithms::symmetric::AES_CBC::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

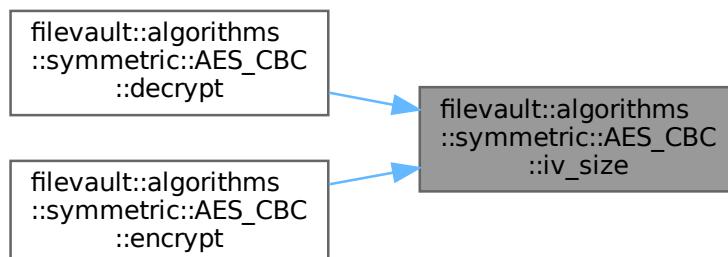

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.1.3.5 iv_size()

```
size_t filevault::algorithms::symmetric::AES_CBC::iv_size () const [inline]
```

Here is the caller graph for this function:

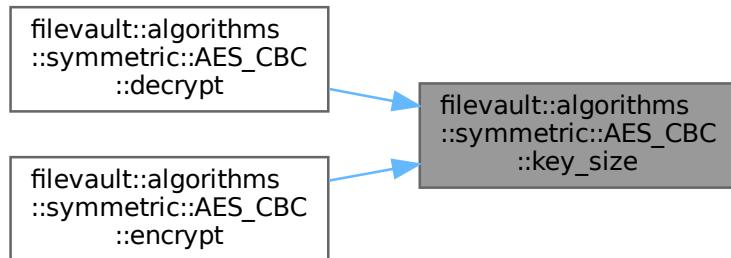

**9.1.3.6 key_size()**

```
size_t filevault::algorithms::symmetric::AES_CBC::key_size () const [inline], [override],
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.1.3.7 name()

```
std::string filevault::algorithms::symmetric::AES_CBC::name () const [override], [virtual]
Get algorithm name.
Implements filevault::core::ICryptoAlgorithm.
```

9.1.3.8 type()

```
core::AlgorithmType filevault::algorithms::symmetric::AES_CBC::type () const [override],
[virtual]
Get algorithm type.
Implements filevault::core::ICryptoAlgorithm.
```

9.1.4 Member Data Documentation

9.1.4.1 botan_name_

```
std::string filevault::algorithms::symmetric::AES_CBC::botan_name_ [private]
```

9.1.4.2 key_bits_

```

9.2.1 Detailed Description

AES-CFB encryption algorithm.

Features:

- Self-synchronizing stream cipher
- No padding required
- Can recover from bit errors (self-healing)
- Encryption and decryption use same operation

9.2.2 Constructor & Destructor Documentation

9.2.2.1 AES_CFB()

```
filevault::algorithms::symmetric::AES_CFB::AES_CFB (
    size_t key_bits = 256) [explicit]
```

Construct AES-CFB with specified key size.

Parameters

<code>key_bits</code>	Key size in bits (128, 192, or 256)
-----------------------	-------------------------------------

9.2.2.2 ~AES_CFB()

```
filevault::algorithms::symmetric::AES_CFB::~AES_CFB () [override], [default]
```

9.2.3 Member Function Documentation

9.2.3.1 block_size()

```
size_t filevault::algorithms::symmetric::AES_CFB::block_size () const [inline]
```

9.2.3.2 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::AES_CFB::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

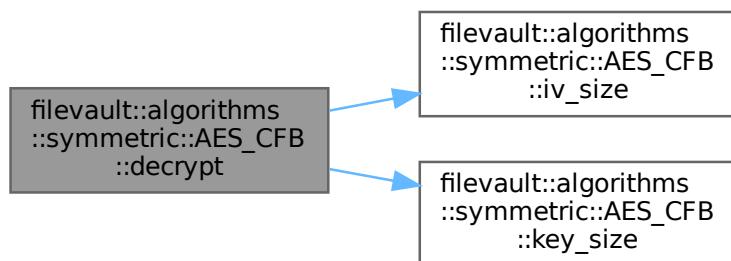

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.2.3.3 encrypt()**

```
core::CryptoResult filevault::algorithms::symmetric::AES_CFB::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

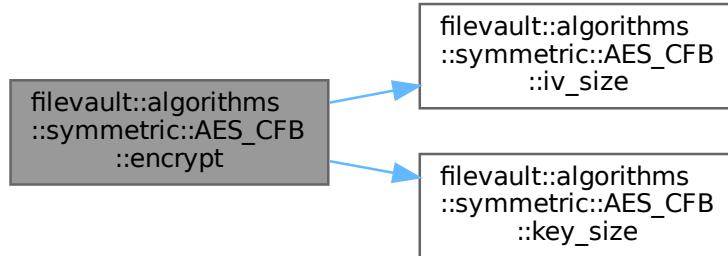

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.2.3.4 is_authenticated()**

```
bool filevault::algorithms::symmetric::AES_CFB::is_authenticated () const [inline]
```

9.2.3.5 is_suitable_for()

```
bool filevault::algorithms::symmetric::AES_CFB::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

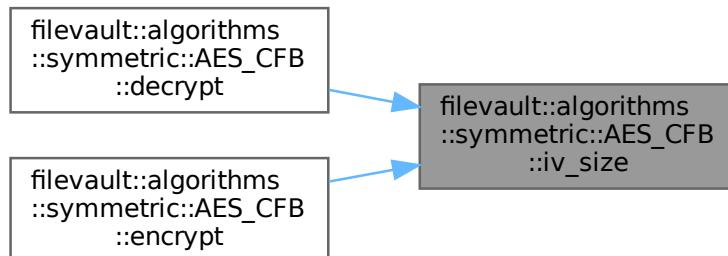

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.2.3.6 iv_size()

```
size_t filevault::algorithms::symmetric::AES_CFB::iv_size () const [inline]
```

Here is the caller graph for this function:

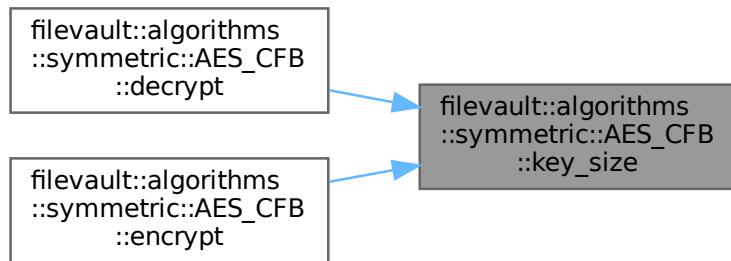

9.2.3.7 key_size()

```
size_t filevault::algorithms::symmetric::AES_CFB::key_size () const [inline], [override],  
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.2.3.8 name()

```
std::string filevault::algorithms::symmetric::AES_CFB::name () const [override], [virtual]
```

Get algorithm name.

Implements [filevault::core::ICryptoAlgorithm](#).

9.2.3.9 requires_padding()

```
bool filevault::algorithms::symmetric::AES_CFB::requires_padding () const [inline]
```

9.2.3.10 type()

```
core::AlgorithmType filevault::algorithms::symmetric::AES_CFB::type () const [override],  
[virtual]
```

Get algorithm type.

Implements [filevault::core::ICryptoAlgorithm](#).

9.3.1 Detailed Description

AES-CTR encryption (stream cipher mode, not authenticated).

Supports 128, 192, and 256 bit keys. No padding needed (stream cipher). Requires unique nonce/counter for each encryption.

Warning

This mode does NOT provide authentication!

9.3.2 Constructor & Destructor Documentation

9.3.2.1 AES_CTR()

```
filevault::algorithms::symmetric::AES_CTR::AES_CTR (
    size_t key_bits = 256) [explicit]
```

9.3.2.2 ~AES_CTR()

```
virtual filevault::algorithms::symmetric::AES_CTR::~AES_CTR () [virtual], [default]

9.4.1 Detailed Description

AES-ECB encryption algorithm.

SECURITY WARNING: ECB mode is insecure!

- Identical plaintext blocks produce identical ciphertext blocks
- Patterns in plaintext are visible in ciphertext
- Use CBC, CTR, or GCM instead for real security

Only use for:

- Educational purposes
- Single block encryption
- Legacy system compatibility

9.4.2 Constructor & Destructor Documentation

9.4.2.1 AES_ECB()

```
filevault::algorithms::symmetric::AES_ECB::AES_ECB (
    size_t key_bits = 256) [explicit]
```

Construct AES-ECB with specified key size.

Parameters

<code>key_bits</code>	Key size in bits (128, 192, or 256)
-----------------------	-------------------------------------

9.4.2.2 ~AES_ECB()

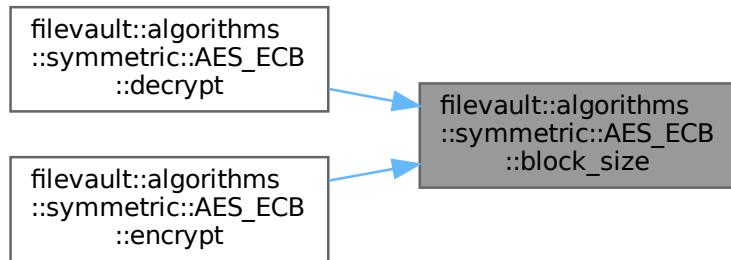

```
filevault::algorithms::symmetric::AES_ECB::~AES_ECB () [override], [default]
```

9.4.3 Member Function Documentation

9.4.3.1 block_size()

```

9.6.1 Detailed Description

AES-OFB encryption algorithm.

Features:

- True stream cipher mode
- No error propagation (bit flip affects only one bit)
- Keystream can be pre-computed
- No padding required

9.6.2 Constructor & Destructor Documentation

9.6.2.1 AES_OFB()

```
filevault::algorithms::symmetric::AES_OFB::AES_OFB (
    size_t key_bits = 256) [explicit]
```

Construct AES-OFB with specified key size.

Parameters

<code>key_bits</code>	Key size in bits (128, 192, or 256)
-----------------------	-------------------------------------

9.6.2.2 ~AES_OFB()

```
filevault::algorithms::symmetric::AES_OFB::~AES_OFB () [override], [default]
```

9.6.3 Member Function Documentation

9.6.3.1 block_size()

```
size_t filevault::algorithms::symmetric::AES_OFB::block_size () const [inline]
```

9.6.3.2 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::AES_OFB::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

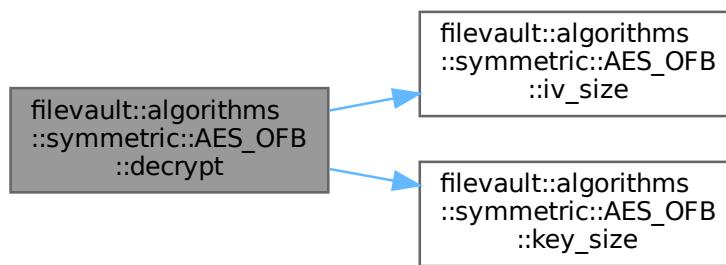

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.6.3.3 encrypt()

```
core::CryptoResult filevault::algorithms::symmetric::AES_OFB::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)

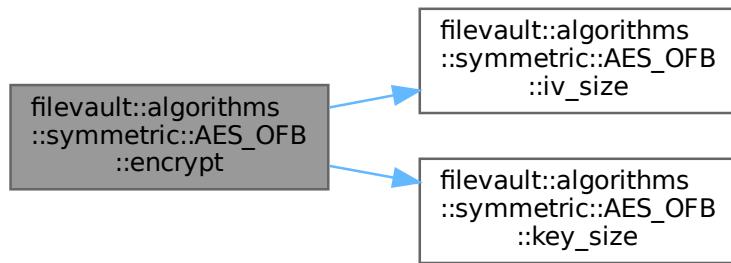

<i>config</i>	Encryption configuration
---------------	--------------------------

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.6.3.4 is_authenticated()**

```
bool filevault::algorithms::symmetric::AES_OFB::is_authenticated () const [inline]
```

9.6.3.5 is_suitable_for()

```
bool filevault::algorithms::symmetric::AES_OFB::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

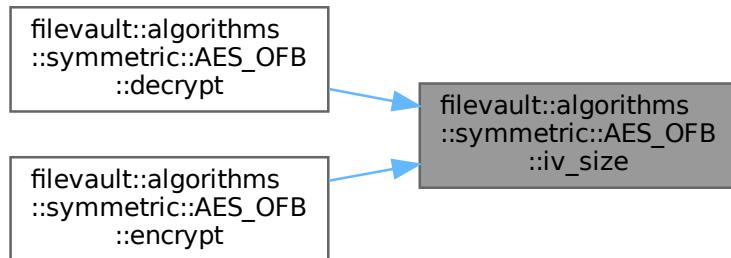

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.6.3.6 iv_size()

```
size_t filevault::algorithms::symmetric::AES_OFB::iv_size () const [inline]
```

Here is the caller graph for this function:

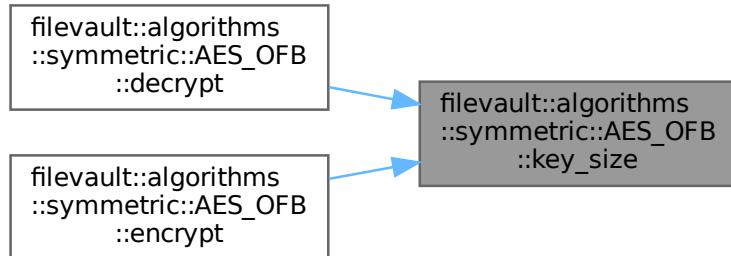

9.6.3.7 key_size()

```
size_t filevault::algorithms::symmetric::AES_OFB::key_size () const [inline], [override],  
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.6.3.8 name()

```
std::string filevault::algorithms::symmetric::AES_OFB::name () const [override], [virtual]
```

Get algorithm name.

Implements [filevault::core::ICryptoAlgorithm](#).

9.6.3.9 requires_padding()

```
bool filevault::algorithms::symmetric::AES_OFB::requires_padding () const [inline]
```

9.6.3.10 type()

```
core::AlgorithmType filevault::algorithms::symmetric::AES_OFB::type () const [override],  
[virtual]
```

Get algorithm type.

Implements [filevault::core::ICryptoAlgorithm](#).

9.6.4 Member Data Documentation

9.6.4.1 botan_name_

```
std::string filevault::algorithms::symmetric::AES_OFB::botan_name_ [private]

9.7.1 Detailed Description

AES-XTS encryption algorithm.

Features:

- Designed for disk/sector encryption
- Uses two keys (effectively double key size)
- Tweak value provides sector-level randomization
- No ciphertext expansion (same size as plaintext)
- Not suitable for streaming data

9.7.2 Constructor & Destructor Documentation

9.7.2.1 AES_XTS()

```
filevault::algorithms::symmetric::AES_XTS::AES_XTS (
    size_t key_bits = 256) [explicit]
```

Construct AES-XTS with specified key size.

Parameters

<code>key_bits</code>	Key size per cipher in bits (128 or 256) Total key is 2x this (256 or 512 bits)
-----------------------	---

9.7.2.2 ~AES_XTS()

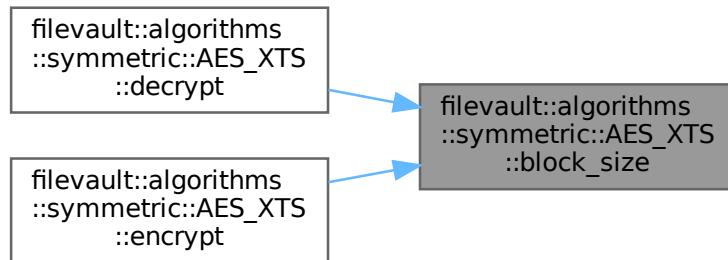

```
filevault::algorithms::symmetric::AES_XTS::~AES_XTS () [override], [default]
```

9.7.3 Member Function Documentation

9.7.3.1 block_size()

```
size_t filevault::algorithms::symmetric::AES_XTS::block_size () const [inline]
```

Here is the caller graph for this function:

9.7.3.2 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::AES_XTS::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

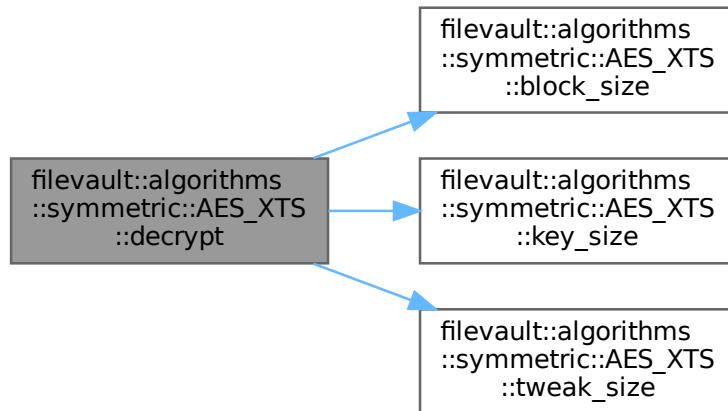

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.7.3.3 encrypt()

```
core::CryptoResult filevault::algorithms::symmetric::AES_XTS::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,

9.12.1 Detailed Description

ARIA-GCM AEAD encryption.

Supports 128, 192, and 256-bit keys. Uses GCM mode for authenticated encryption.

9.12.2 Constructor & Destructor Documentation

9.12.2.1 ARIA_GCM()

```
filevault::algorithms::symmetric::ARIA_GCM::ARIA_GCM (
    size_t key_bits = 256) [explicit]
```

Construct ARIA-GCM with specified key size.

Parameters

<i>key_bits</i>	Key size in bits (128, 192, or 256)
-----------------	-------------------------------------

9.12.2.2 ~ARIA_GCM()

```
virtual filevault::algorithms::symmetric::ARIA_GCM::~ARIA_GCM () [virtual], [default]
```

9.12.3 Member Function Documentation

9.12.3.1 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::ARIA_GCM::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

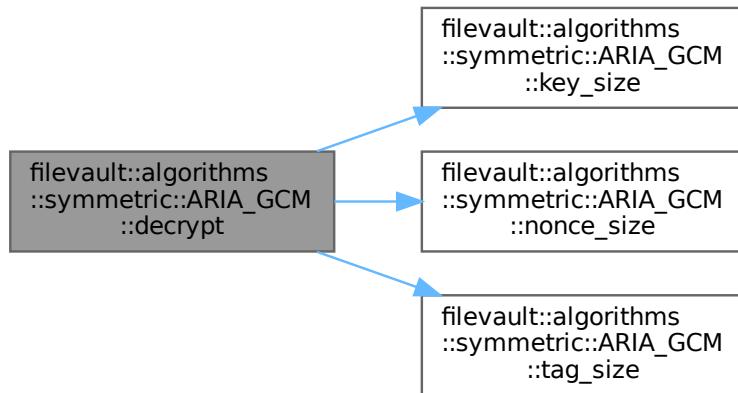

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.12.3.2 encrypt()

```
core::CryptoResult filevault::algorithms::symmetric::ARIA_GCM::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

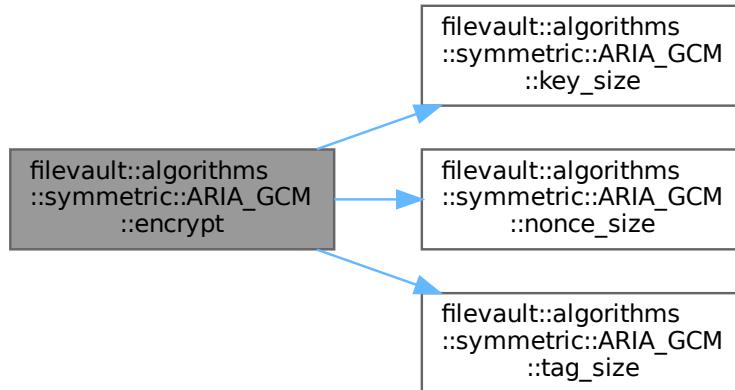

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.12.3.3 is_suitable_for()**

```
bool filevault::algorithms::symmetric::ARIA_GCM::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

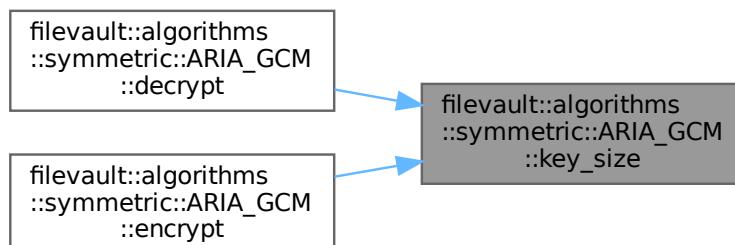

9.12.3.4 key_size()

```
size_t filevault::algorithms::symmetric::ARIA_GCM::key_size () const [inline], [override],
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

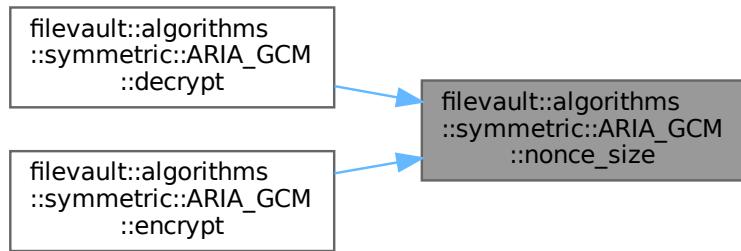

9.12.3.5 name()

```
std::string filevault::algorithms::symmetric::ARIA_GCM::name () const [override], [virtual]
Get algorithm name.
Implements filevault::core::ICryptoAlgorithm.
```

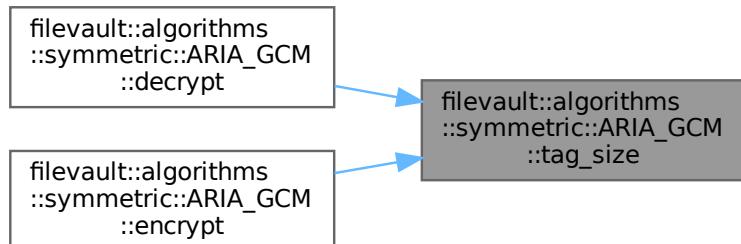

9.12.3.6 nonce_size()

```
size_t filevault::algorithms::symmetric::ARIA_GCM::nonce_size () const [inline]
Here is the caller graph for this function:
```

9.12.3.7 tag_size()

```
size_t filevault::algorithms::symmetric::ARIA_GCM::tag_size () const [inline]
Here is the caller graph for this function:
```

9.12.3.8 type()

```
core::AlgorithmType filevault::algorithms::symmetric::ARIA_GCM::type () const [override],
[virtual]
Get algorithm type.
Implements filevault::core::ICryptoAlgorithm.
```

9.12.4 Member Data Documentation

9.12.4.1 botan_name_

```
std::string filevault::algorithms::symmetric::ARIA_GCM::botan_name_ [private]

Decompress data.

Public Member Functions inherited from [filevault::compression::ICompressor](#)

- virtual ~[ICompressor](#) ()=default

9.17.1 Detailed Description

BZIP2 compressor (better ratio, slower).

9.17.2 Member Function Documentation

9.17.2.1 compress()

```
CompressionResult filevault::compression::Bzip2Compressor::compress (
    std::span< const uint8_t > input,
    int level = 6) [override], [virtual]
```

Compress data.

Parameters

<i>input</i>	Data to compress
<i>level</i>	Compression level (1-9, algorithm-specific)

Returns

Compressed data

Implements [filevault::compression::ICompressor](#).

9.17.2.2 decompress()

```
CompressionResult filevault::compression::Bzip2Compressor::decompress (
    std::span< const uint8_t > input) [override], [virtual]
```

Decompress data.

Parameters

<i>input</i>	Compressed data
--------------	-----------------

Returns

Decompressed data

Implements [filevault::compression::ICompressor](#).

9.17.2.3 name()

```
std::string filevault::compression::Bzip2Compressor::name () const [inline], [override], [virtual]
```

Get compressor name.

Implements [filevault::compression::ICompressor](#).

The documentation for this class was generated from the following files:

9.18.1 Detailed Description

[Caesar](#) Cipher - Educational only.

Simple substitution cipher that shifts characters by a fixed offset. Used by Julius [Caesar](#) for military messages (~50 BC).

Security: COMPLETELY BROKEN - Only 26 possible keys! Purpose: Educational demonstration of cryptanalysis

See also

https://en.wikipedia.org/wiki/Caesar_cipher

Simple substitution cipher that shifts characters by a fixed offset. Used by Julius [Caesar](#) for military messages (~50 BC).

Security: COMPLETELY BROKEN - Only 26 possible keys! Purpose: Educational demonstration of cryptanalysis

9.18.2 Constructor & Destructor Documentation

9.18.2.1 Caesar() [1/2]

```
filevault::algorithms::classical::Caesar::Caesar (
    int shift = 3) [explicit]
```

9.18.2.2 Caesar() [2/2]

```
filevault::algorithms::classical::Caesar::Caesar (
    int shift = 3) [explicit]
```

9.18.3 Member Function Documentation

9.18.3.1 brute_force() [1/2]

```
std::string filevault::algorithms::classical::Caesar::brute_force (
    const std::string & ciphertext) [static]
```

Brute force attack demonstration.

Parameters

<i>ciphertext</i>	Encrypted text
-------------------	----------------

Returns

All 26 possible decryptions

9.18.3.2 brute_force() [2/2]

```
std::string filevault::algorithms::classical::Caesar::brute_force (
    const std::string & ciphertext) [static]
```

9.18.3.3 decrypt() [1/2]

```
core::CryptoResult filevault::algorithms::classical::Caesar::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

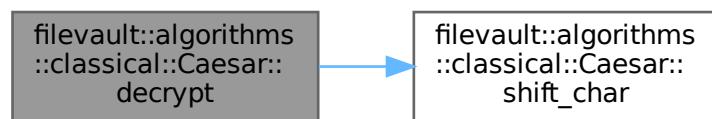

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.18.3.4 decrypt() [2/2]

```
core::CryptoResult filevault::algorithms::classical::Caesar::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.5 encrypt() [1/2]

```
core::CryptoResult filevault::algorithms::classical::Caesar::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

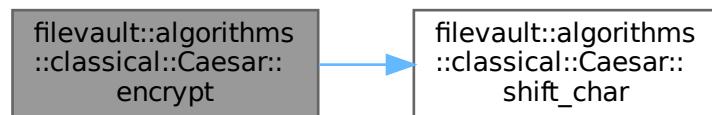

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.18.3.6 encrypt() [2/2]

```
core::CryptoResult filevault::algorithms::classical::Caesar::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.7 frequency_analysis()

```
double filevault::algorithms::classical::Caesar::frequency_analysis (
    const std::string & text) [static]
```

9.18.3.8 is_suitable_for() [1/2]

```
bool filevault::algorithms::classical::Caesar::is_suitable_for (
    core::SecurityLevel level) const [inline], [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.9 is_suitable_for() [2/2]

```
bool filevault::algorithms::classical::Caesar::is_suitable_for (
    core::SecurityLevel level) const [inline], [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.10 key_size() [1/2]

```
size_t filevault::algorithms::classical::Caesar::key_size () const [inline], [override],
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.11 key_size() [2/2]

```
size_t filevault::algorithms::classical::Caesar::key_size () const [inline], [override],
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.12 name() [1/2]

```
std::string filevault::algorithms::classical::Caesar::name () const [inline], [override],
[virtual]
```

Get algorithm name.

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.13 name() [2/2]

```
std::string filevault::algorithms::classical::Caesar::name () const [inline], [override],  
[virtual]
```

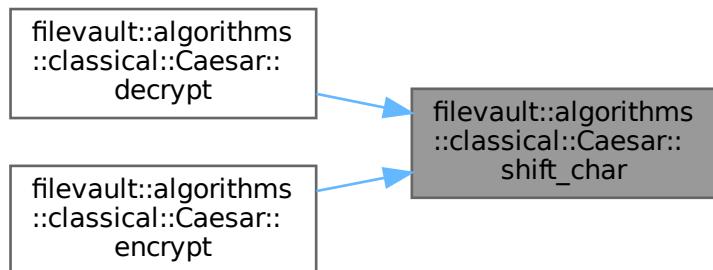

Get algorithm name.

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.14 shift_char() [1/2]

```
char filevault::algorithms::classical::Caesar::shift_char (  
    char ch,  
    int shift) const [private]
```

Here is the caller graph for this function:

9.18.3.15 shift_char() [2/2]

```
char filevault::algorithms::classical::Caesar::shift_char (  
    char ch,  
    int shift) const [private]
```

9.18.3.16 type() [1/2]

```
core::AlgorithmType filevault::algorithms::classical::Caesar::type () const [inline], [override],  
[virtual]
```

Get algorithm type.

Implements [filevault::core::ICryptoAlgorithm](#).

9.18.3.17 type() [2/2]

```
core::AlgorithmType filevault::algorithms::classical::Caesar::type () const [inline], [override],  
[virtual]
```

Get algorithm type.

Implements [filevault::core::ICryptoAlgorithm](#).

9.19.1 Detailed Description

Camellia-GCM AEAD encryption.

Supports 128, 192, and 256-bit keys. Uses GCM mode for authenticated encryption.

9.19.2 Constructor & Destructor Documentation

9.19.2.1 Camellia_GCM()

```
filevault::algorithms::symmetric::Camellia_GCM::Camellia_GCM (
    size_t key_bits = 256) [explicit]
```

Construct Camellia-GCM with specified key size.

Parameters

<i>key_bits</i>	Key size in bits (128, 192, or 256)
-----------------	-------------------------------------

9.19.2.2 ~Camellia_GCM()

```
virtual filevault::algorithms::symmetric::Camellia_GCM::~Camellia_GCM () [virtual], [default]
```

9.19.3 Member Function Documentation

9.19.3.1 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::Camellia_GCM::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

<i>ciphertext</i>	Encrypted data
-------------------	----------------

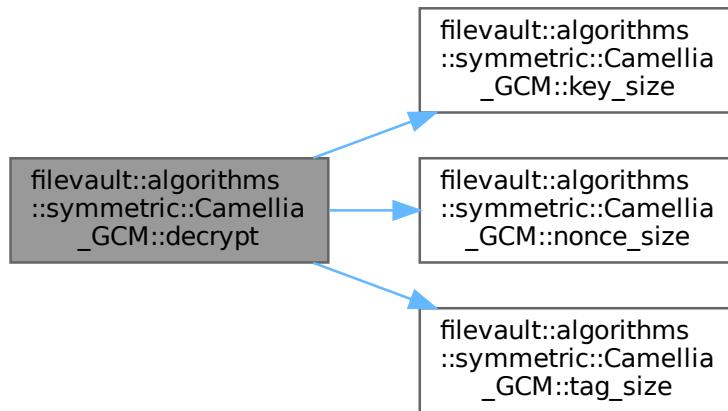

<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.19.3.2 encrypt()**

```
core::CryptoResult filevault::algorithms::symmetric::Camellia_GCM::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

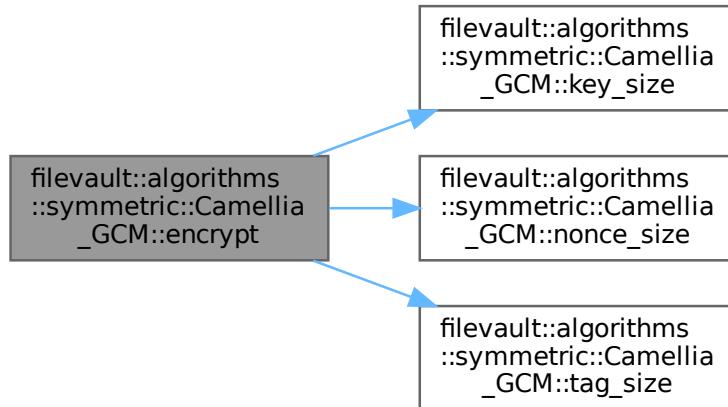

Parameters

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).
Here is the call graph for this function:

**9.19.3.3 is_suitable_for()**

```
bool filevault::algorithms::symmetric::Camellia_GCM::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

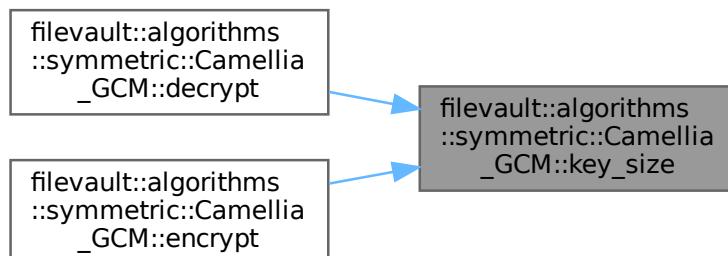

9.19.3.4 key_size()

```
size_t filevault::algorithms::symmetric::Camellia_GCM::key_size () const [inline], [override], [virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

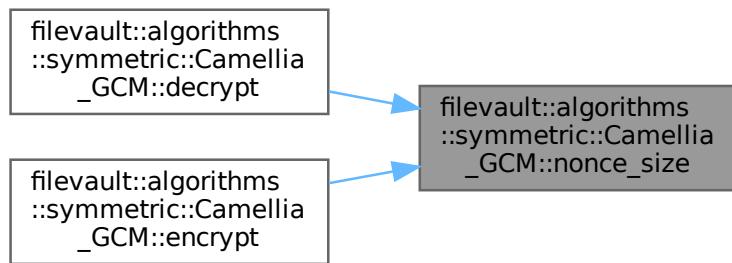

9.19.3.5 name()

```
std::string filevault::algorithms::symmetric::Camellia_GCM::name () const [override], [virtual]
Get algorithm name.
Implements filevault::core::ICryptoAlgorithm.
```

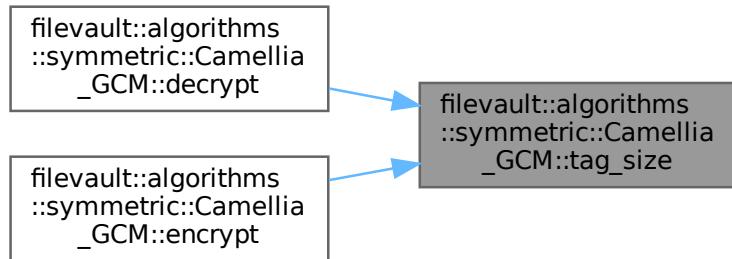

9.19.3.6 nonce_size()

```
size_t filevault::algorithms::symmetric::Camellia_GCM::nonce_size () const [inline]
Here is the caller graph for this function:
```

9.19.3.7 tag_size()

```
size_t filevault::algorithms::symmetric::Camellia_GCM::tag_size () const [inline]
Here is the caller graph for this function:
```

9.19.3.8 type()

```
core::AlgorithmType filevault::algorithms::symmetric::Camellia_GCM::type () const [override],
[virtual]
Get algorithm type.
Implements filevault::core::ICryptoAlgorithm.
```

9.19.4 Member Data Documentation

9.19.4.1 botan_name_

```
std::string filevault::algorithms::symmetric::Camellia_GCM::botan_name_ [private]
```

9.20.1 Detailed Description

ChaCha20-Poly1305 AEAD encryption.

ChaCha20-Poly1305 is a modern AEAD cipher combining:

- ChaCha20 stream cipher (designed by Daniel J. Bernstein)
- Poly1305 MAC for authentication

Benefits over AES-GCM:

- No need for AES-NI hardware acceleration
- Constant-time implementation easier to achieve
- Better performance on software-only platforms
- Recommended by IETF (RFC 8439)

Security:

- 256-bit key
- 96-bit nonce (12 bytes) - MUST be unique per encryption
- 128-bit authentication tag (16 bytes)
- Provides confidentiality and authenticity

9.20.2 Constructor & Destructor Documentation

9.20.2.1 ChaCha20Poly1305()

```
filevault::algorithms::symmetric::ChaCha20Poly1305::ChaCha20Poly1305 ()
```

9.20.2.2 ~ChaCha20Poly1305()

```
virtual filevault::algorithms::symmetric::ChaCha20Poly1305::~ChaCha20Poly1305 () [virtual],  
[default]
```

9.20.3 Member Function Documentation

9.20.3.1 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::ChaCha20Poly1305::decrypt (  
    std::span< const uint8_t > ciphertext,  
    std::span< const uint8_t > key,  
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

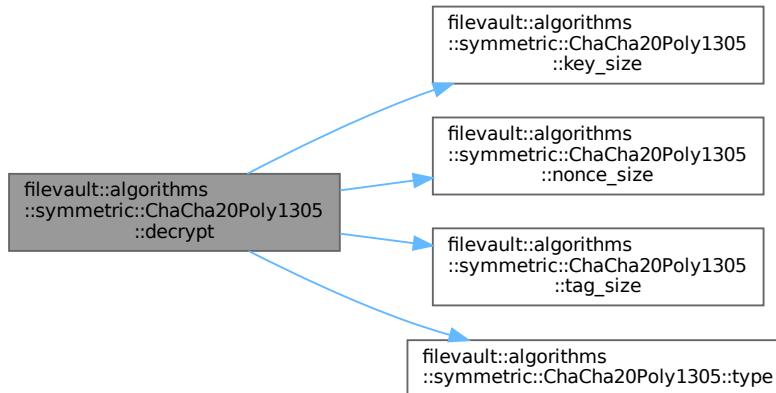

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.20.3.2 encrypt()

```
core::CryptoResult filevault::algorithms::symmetric::ChaCha20Poly1305::encrypt (  
    std::span< const uint8_t > plaintext,  
    std::span< const uint8_t > key,  
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

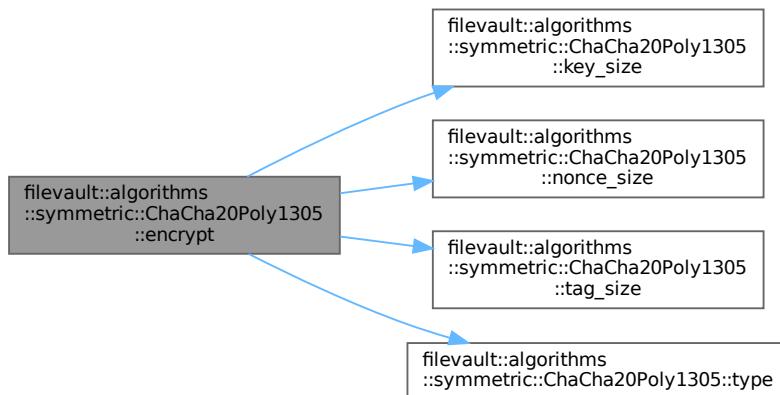

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.20.3.3 is_suitable_for()

```
bool filevault::algorithms::symmetric::ChaCha20Poly1305::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

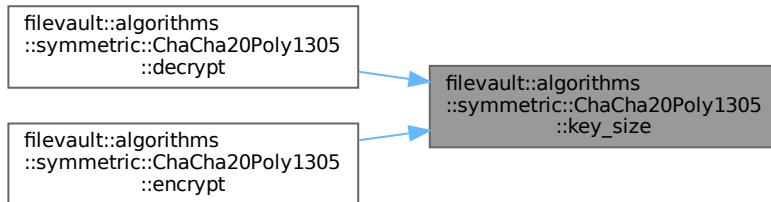

9.20.3.4 key_size()

```
size_t filevault::algorithms::symmetric::ChaCha20Poly1305::key_size () const [inline], [override], [virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.20.3.5 name()

```
std::string filevault::algorithms::symmetric::ChaCha20Poly1305::name () const [override],  
[virtual]
```

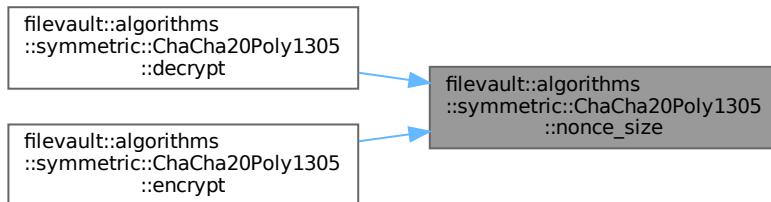

Get algorithm name.

Implements [filevault::core::ICryptoAlgorithm](#).

9.20.3.6 nonce_size()

```
size_t filevault::algorithms::symmetric::ChaCha20Poly1305::nonce_size () const [inline]
```

9.28.1 Detailed Description

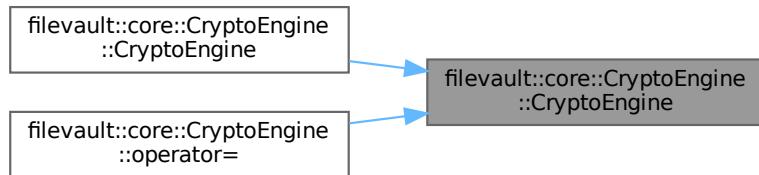

Main cryptographic engine Manages algorithms and provides key derivation.

9.28.2 Constructor & Destructor Documentation

9.28.2.1 CryptoEngine() [1/2]

```
filevault::core::CryptoEngine::CryptoEngine ()
```

Here is the caller graph for this function:

9.28.2.2 ~CryptoEngine()

```
filevault::core::CryptoEngine::~CryptoEngine ()
```

9.28.2.3 CryptoEngine() [2/2]

```
filevault::core::CryptoEngine::CryptoEngine (
    const CryptoEngine & ) [delete]
```

Here is the call graph for this function:

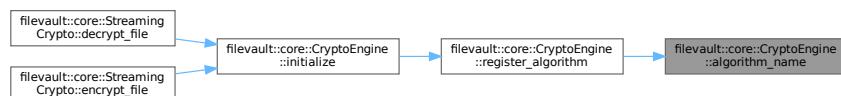

9.28.3 Member Function Documentation

9.28.3.1 algorithm_name()

```
std::string filevault::core::CryptoEngine::algorithm_name (
    AlgorithmType type) [static]
```

Get algorithm name from type.

Here is the caller graph for this function:

9.28.3.2 derive_key()

```
std::vector< uint8_t > filevault::core::CryptoEngine::derive_key (
    const std::string & password,
    const std::vector< uint8_t > & salt,
    const EncryptionConfig & config)
```

Derive key from password using KDF.

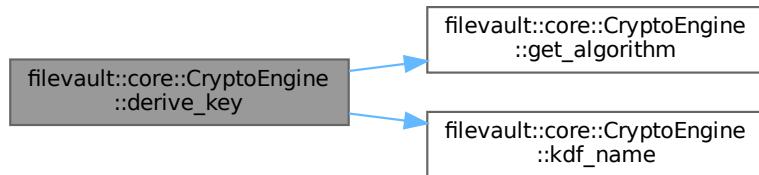

Parameters

<i>password</i>	User password
<i>salt</i>	Random salt (MUST be unique per file)
<i>config</i>	Configuration containing KDF parameters

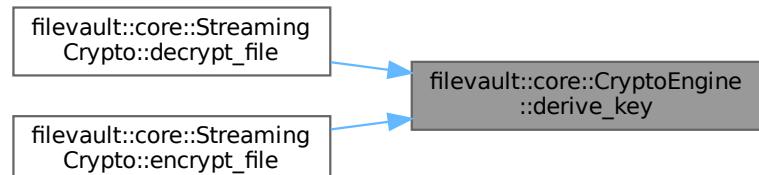

Returns

Derived key

Here is the call graph for this function:

Here is the caller graph for this function:

9.28.3.3 generate_nonce()

```
std::vector< uint8_t > filevault::core::CryptoEngine::generate_nonce (
    size_t length = 12) [static]
```

Generate random nonce/IV.

Parameters

<i>length</i>	Nonce length (12 for GCM, 16 for CBC)
---------------	---------------------------------------

Here is the caller graph for this function:

9.28.3.4 generate_salt()

```
std::vector< uint8_t > filevault::core::CryptoEngine::generate_salt (
    size_t length = 32) [static]
```

Generate random salt (32 bytes default).

Here is the caller graph for this function:

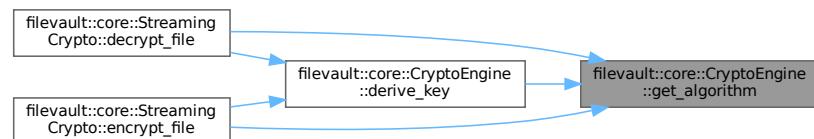

9.28.3.5 get_algorithm()

```
ICryptoAlgorithm * filevault::core::CryptoEngine::get_algorithm (
    AlgorithmType type)
```

Get algorithm by type.

Here is the caller graph for this function:

9.28.3.6 initialize()

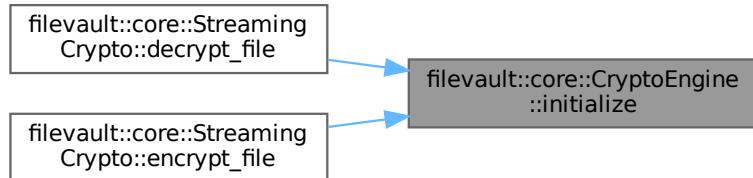

```
void filevault::core::CryptoEngine::initialize ()
```

Initialize engine with default algorithms.

Here is the call graph for this function:

Here is the caller graph for this function:

9.28.3.7 kdf_name()

```
std::string filevault::core::CryptoEngine::kdf_name (
    KDFType type) [static]
```

Get KDF name from type.

Here is the caller graph for this function:

9.28.3.8 operator=()

```
CryptoEngine & filevault::core::CryptoEngine::operator= (
    const CryptoEngine & ) [delete]
```

Here is the call graph for this function:

9.28.3.9 parse_algorithm()

```
std::optional< AlgorithmType > filevault::core::CryptoEngine::parse_algorithm (
    const std::string & name) [static]
```

Parse algorithm from string.

9.28.3.10 parse_kdf()

```
std::optional< KDFType > filevault::core::CryptoEngine::parse_kdf (
    const std::string & name) [static]
```

Parse KDF from string.

9.28.3.11 parse_security_level()

```
std::optional< SecurityLevel > filevault::core::CryptoEngine::parse_security_level (
    const std::string & name) [static]
```

Parse security level from string.

9.28.3.12 register_algorithm()

```
void filevault::core::CryptoEngine::register_algorithm (
    std::unique_ptr< ICryptoAlgorithm > algorithm)
```

Register a custom algorithm.

Here is the call graph for this function:

Here is the caller graph for this function:

9.28.3.13 security_level_name()

```
std::string filevault::core::CryptoEngine::security_level_name (
    SecurityLevel level) [static]
```

Get security level name from type.

9.28.4 Member Data Documentation

9.30 filevault::utils::CryptoUtils Class Reference

Crypto utility functions.

```
#include <crypto_utils.hpp>
```

Static Public Member Functions

- static std::string `hex_encode` (std::span< const uint8_t > data)
Encode bytes to hexadecimal string.
- static std::vector< uint8_t > `hex_decode` (const std::string &hex)
Decode hexadecimal string to bytes.
- static std::string `format_bytes` (size_t bytes)
Format bytes as human-readable size.

9.30.1 Detailed Description

Crypto utility functions.

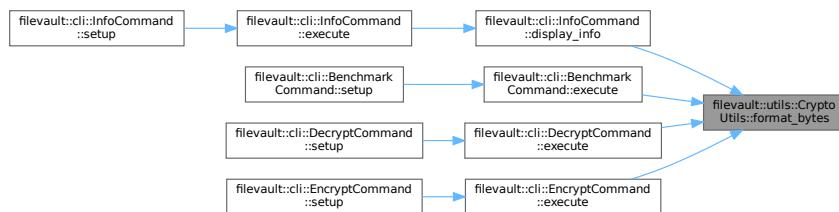

9.30.2 Member Function Documentation

9.30.2.1 format_bytes()

```
std::string filevault::utils::CryptoUtils::format_bytes (
    size_t bytes) [static]
```

Format bytes as human-readable size.

Here is the caller graph for this function:

9.30.2.2 hex_decode()

```
std::vector< uint8_t > filevault::utils::CryptoUtils::hex_decode (
    const std::string & hex) [static]
```

Decode hexadecimal string to bytes.

9.30.2.3 hex_encode()

```
std::string filevault::utils::CryptoUtils::hex_encode (
    std::span< const uint8_t > data) [static]
```

Encode bytes to hexadecimal string.

The documentation for this class was generated from the following files:

9.33.1 Detailed Description

Dilithium Digital Signature Algorithm.

NIST FIPS 204 (ML-DSA) - Post-quantum secure digital signatures

Dilithium is a lattice-based signature scheme that provides:

- EUF-CMA security
- Resistance to quantum computer attacks
- Efficient signing and verification

Variants:

- Dilithium2: ~128-bit post-quantum security
- Dilithium3: ~192-bit post-quantum security (recommended)
- Dilithium5: ~256-bit post-quantum security

9.33.2 Member Enumeration Documentation

9.33.2.1 Variant

```
enum class filevault::algorithms::pqc::Dilithium::Variant [strong]
```

Enumerator

Dilithium2	
Dilithium3	
Dilithium5	

9.33.3 Constructor & Destructor Documentation

9.33.3.1 Dilithium()

```
filevault::algorithms::pqc::Dilithium::Dilithium (
    Variant variant = Variant::Dilithium3) [explicit]
```

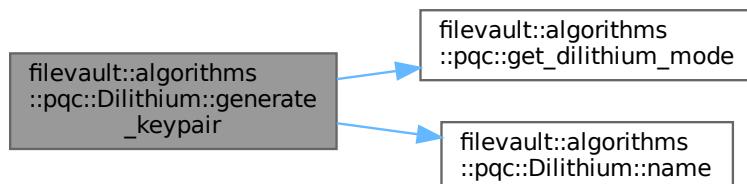

9.33.4 Member Function Documentation

9.33.4.1 generate_keypair()

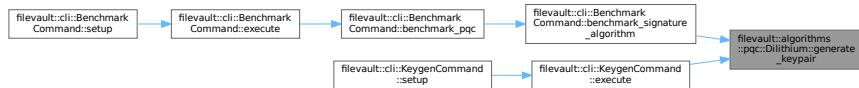

PQKeyPair filevault::algorithms::pqc::Dilithium::generate_keypair ()

Generate **Dilithium** key pair.

Here is the call graph for this function:

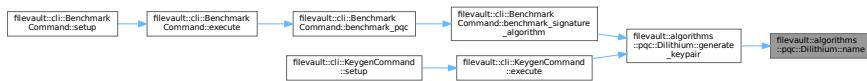

Here is the caller graph for this function:

9.33.4.2 name()

```
std::string filevault::algorithms::pqc::Dilithium::name () const
```

Here is the caller graph for this function:

9.33.4.3 private_key_size()

```
size_t filevault::algorithms::pqc::Dilithium::private_key_size () const
```

Get private key size for this variant.

9.33.4.4 public_key_size()

```
size_t filevault::algorithms::pqc::Dilithium::public_key_size () const
```

Get public key size for this variant.

9.33.4.5 sign()

```
std::vector< uint8_t > filevault::algorithms::pqc::Dilithium::sign (
    std::span< const uint8_t > message,
    std::span< const uint8_t > private_key)
```

Sign a message.

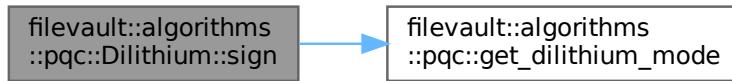

Parameters

<i>message</i>	Message to sign
<i>private_key</i>	Signer's private key

Returns

Signature

Here is the call graph for this function:

Here is the caller graph for this function:

**9.33.4.6 signature_size()**

```
size_t filevault::algorithms::pqc::Dilithium::signature_size () const
Get signature size for this variant.
```

9.33.4.7 verify()

```
bool filevault::algorithms::pqc::Dilithium::verify (
    std::span< const uint8_t > message,
    std::span< const uint8_t > signature,
    std::span< const uint8_t > public_key)
```

Verify a signature.

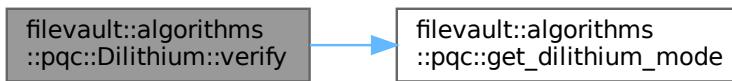

Parameters

<i>message</i>	Original message
<i>signature</i>	Signature to verify
<i>public_key</i>	Signer's public key

Returns

true if signature is valid

Here is the call graph for this function:

Here is the caller graph for this function:

9.35.1 Detailed Description

Hybrid encryption using `ECDH` + AES-GCM.

Combines the security of ECC key exchange with the efficiency of symmetric encryption for encrypting arbitrary-sized data.

Encryption flow:

1. Generate ephemeral `ECDH` key pair
2. Derive shared secret with recipient's public key
3. Use KDF to derive AES key from shared secret
4. Encrypt data with AES-GCM
5. Output: ephemeral public key + nonce + ciphertext + tag

9.35.2 Constructor & Destructor Documentation

9.35.2.1 `ECCHybrid()`

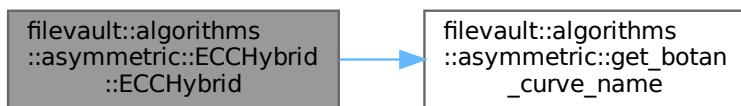

```
filevault::algorithms::asymmetric::ECCHybrid::ECCHybrid (
    ECCurve curve = ECCurve::SECP256R1) [explicit]
```

Construct ECC hybrid encryption.

Parameters

<code>curve</code>	Elliptic curve to use
--------------------	-----------------------

Here is the call graph for this function:

9.35.2.2 ~ECCHybrid()

```
filevault::algorithms::asymmetric::ECCHybrid::~ECCHybrid () [override], [default]
```

9.35.3 Member Function Documentation

9.35.3.1 decrypt()

```
core::CryptoResult filevault::algorithms::asymmetric::ECCHybrid::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt with own private key.

Parameters

<i>ciphertext</i>	Encrypted data (includes ephemeral public key)
<i>key</i>	Own private key
<i>config</i>	Encryption configuration

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.35.3.2 encrypt()

```
core::CryptoResult filevault::algorithms::asymmetric::ECCHybrid::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt with recipient's public key.

Parameters

<i>plaintext</i>	Data to encrypt
<i>key</i>	Recipient's public key
<i>config</i>	Encryption configuration

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

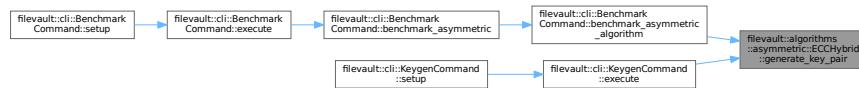

9.35.3.3 generate_key_pair()

```
ECCKeyPair filevault::algorithms::asymmetric::ECCHybrid::generate_key_pair ()
```

Generate a new ECC key pair for this hybrid scheme.

Here is the caller graph for this function:

9.35.3.4 is_suitable_for()

```
bool filevault::algorithms::asymmetric::ECCHybrid::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

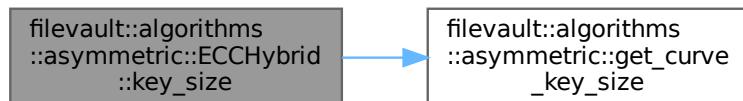

9.35.3.5 key_size()

```
size_t filevault::algorithms::asymmetric::ECCHybrid::key_size () const [override], [virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.35.3.6 name()

```
std::string filevault::algorithms::asymmetric::ECCHybrid::name () const [override], [virtual]
```

Get algorithm name.

9.37.1 Detailed Description

Elliptic Curve Diffie-Hellman ([ECDH](#)) key exchange.

Used for secure key agreement between two parties. Each party generates a key pair, exchanges public keys, and derives the same shared secret.

9.37.2 Constructor & Destructor Documentation

9.37.2.1 ECDH()

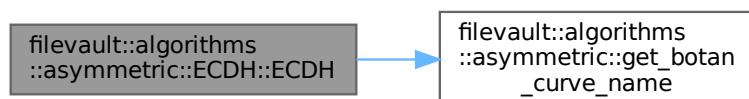

```
filevault::algorithms::asymmetric::ECDH::ECDH (
    ECCurve curve = ECCurve::SECP256R1) [explicit]
```

Construct [ECDH](#) with specified curve.

Parameters

<i>curve</i>	Elliptic curve to use
--------------	-----------------------

Here is the call graph for this function:

9.37.2.2 ~ECDH()

```
filevault::algorithms::asymmetric::ECDH::~ECDH () [default]
```

9.37.3.2 derive_shared_secret()

```
ECDHResult filevault::algorithms::asymmetric::ECDH::derive_shared_secret (
    std::span< const uint8_t > own_private_key,
    std::span< const uint8_t > peer_public_key)
```

Derive shared secret from own private key and peer's public key.

Parameters

<i>own_private_key</i>	Our private key
<i>peer_public_key</i>	Peer's public key

Returns

Shared secret that both parties can derive

Here is the call graph for this function:

9.37.3.3 generate_key_pair()

```
ECCKeyPair filevault::algorithms::asymmetric::ECDH::generate_key_pair ()
```

Generate a new ECDH key pair.

```
ECDSASignResult filevault::algorithms::asymmetric::ECDSA::sign (
    std::span< const uint8_t > data,
    std::span< const uint8_t > private_key)
```

Sign data with private key.

Parameters

<i>data</i>	Data to sign
<i>private_key</i>	ECDSA private key

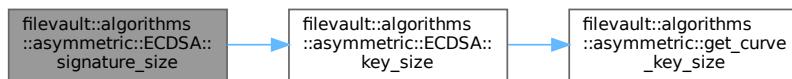

Returns

Signature

9.39.3.6 signature_size()

```
size_t filevault::algorithms::asymmetric::ECDSA::signature_size () const
```

Here is the call graph for this function:

**9.39.3.7 verify()**

```
bool filevault::algorithms::asymmetric::ECDSA::verify (
    std::span< const uint8_t > data,
    std::span< const uint8_t > signature,
    std::span< const uint8_t > public_key)
```

Verify signature with public key.

Parameters

<i>data</i>	Original data
<i>signature</i>	Signature to verify
<i>public_key</i>	ECDSA public key

Returns

true if signature is valid

9.43.1 Detailed Description

Archive file entry metadata.

9.43.2 Member Function Documentation

9.43.2.1 deserialize()

```
FileEntry filevault::archive::FileEntry::deserialize (
    std::span< const uint8_t > data,
    size_t & offset) [static]
```

Here is the caller graph for this function:

9.43.2.2 serialize()

```
std::vector< uint8_t > filevault::archive::FileEntry::serialize () const
```

9.43.3 Member Data Documentation

9.43.3.1 file_size

```
uint64_t filevault::archive::FileEntry::file_size
```

9.43.3.2 filename

```
std::string filevault::archive::FileEntry::filename
```

9.43.3.3 modified_time

```
uint64_t filevault::archive::FileEntry::modified_time
```

9.43.3.4 offset

```
uint64_t filevault::archive::FileEntry::offset
```

9.43.3.5 permissions

```
uint32_t filevault::archive::FileEntry::permissions
```

The documentation for this struct was generated from the following files:

- include/filevault/archive/[archive_format.hpp](#)
- src/archive/[archive_format.cpp](#)

9.44 filevault::core::FileFormatHandler Class Reference

File format handler.

```
#include <file_format.hpp>
```

Static Public Member Functions

- static `FileHeader create_header (AlgorithmType algo_type, KDFType kdf_type, const EncryptionConfig &config, std::span< const uint8_t > salt, std::span< const uint8_t > nonce, bool compressed)`
Create header from encryption config.
- static bool `write_file (const std::string &path, const FileHeader &header, std::span< const uint8_t > cipher-text, std::span< const uint8_t > auth_tag)`
Write encrypted file with header.
- static std::tuple< `FileHeader`, std::vector< `uint8_t` >, std::vector< `uint8_t` > > `read_file (const std::string &path)`
Read encrypted file and parse header.
- static `AlgorithmID to_algorithm_id (AlgorithmType type)`
Convert AlgorithmType to AlgorithmID.
- static `AlgorithmType from_algorithm_id (AlgorithmID id)`
Convert AlgorithmID to AlgorithmType.
- static `KDFID to_kdf_id (KDFType type)`
Convert KDFType to KDFID.
- static `KDFType from_kdf_id (KDFID id)`
Convert KDFID to KDFType.
- static `CompressionID to_compression_id (const std::string &type)`
Convert compression type to CompressionID.
- static `std::string from_compression_id (CompressionID id)`
Convert CompressionID to string.
- static bool `is_legacy_format (const std::string &path)`
Detect if file is legacy format (no magic bytes).
- static std::tuple< std::vector< `uint8_t` >, std::vector< `uint8_t` >, std::vector< `uint8_t` > > `read_legacy_file (const std::string &path)`
Read legacy format file (old format without header).

9.44.1 Detailed Description

File format handler.

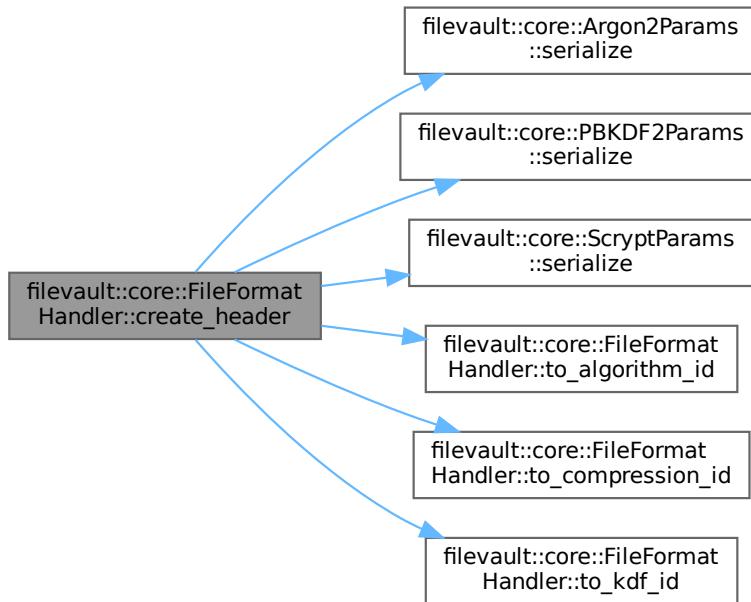

9.44.2 Member Function Documentation

9.44.2.1 create_header()

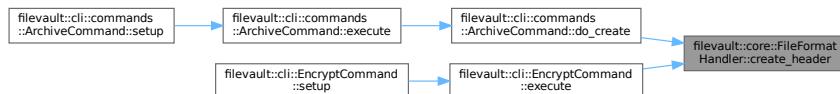

```
FileHeader filevault::core::FileFormatHandler::create_header (
    AlgorithmType algo_type,
    KDFType kdf_type,
    const EncryptionConfig & config,
    std::span< const uint8_t > salt,
    std::span< const uint8_t > nonce,
    bool compressed) [static]
```

Create header from encryption config.

Here is the call graph for this function:

Here is the caller graph for this function:

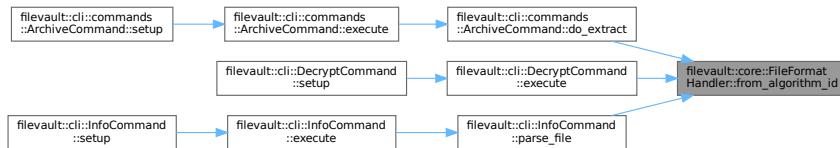

9.44.2.2 `from_algorithm_id()`

```
AlgorithmType filevault::core::FileFormatHandler::from_algorithm_id (
    AlgorithmID id) [static]
```

Convert `AlgorithmID` to `AlgorithmType`.

Here is the caller graph for this function:

9.44.2.3 `from_compression_id()`

```
std::string filevault::core::FileFormatHandler::from_compression_id (
```

```
CompressionID id) [static]
```

Convert `CompressionID` to string.

Here is the caller graph for this function:

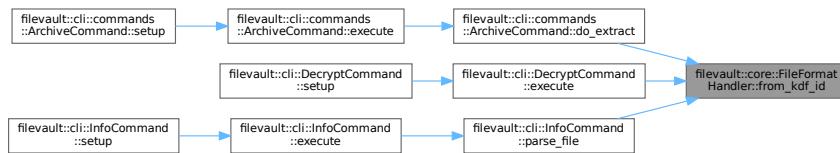

9.44.2.4 from_kdf_id()

```
KDFType filevault::core::FileFormatHandler::from_kdf_id (
    KDFID id) [static]
```

Convert `KDFID` to `KDFType`.

Here is the caller graph for this function:

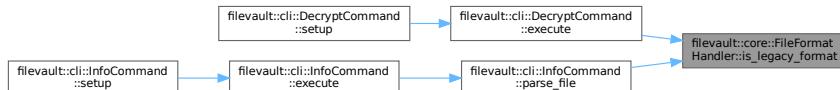

9.44.2.5 is_legacy_format()

```
bool filevault::core::FileFormatHandler::is_legacy_format (
    const std::string & path) [static]
```

Detect if file is legacy format (no magic bytes).

Here is the caller graph for this function:

9.44.2.6 read_file()

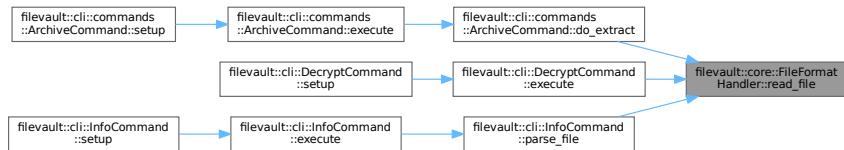

```
std::tuple< FileHeader, std::vector< uint8_t >, std::vector< uint8_t > > filevault::core::FileFormatHandler::read_file (
    const std::string & path) [static]
```

Read encrypted file and parse header.

Here is the call graph for this function:

Here is the caller graph for this function:

9.44.2.7 read_legacy_file()

```
std::tuple< std::vector< uint8_t >, std::vector< uint8_t >, std::vector< uint8_t > > filevault::core::FileFormatHandler::read_legacy_file (
    const std::string & path) [static]
```

Read legacy format file (old format without header).

9.44.2.8 to_algorithm_id()

```
AlgorithmID filevault::core::FileFormatHandler::to_algorithm_id (
    AlgorithmType type) [static]
```

Convert [AlgorithmType](#) to [AlgorithmID](#).

Here is the caller graph for this function:

9.44.2.9 to_compression_id()

```
CompressionID filevault::core::FileFormatHandler::to_compression_id (
    const std::string & type) [static]
```

Convert compression type to [CompressionID](#).

Here is the caller graph for this function:

9.44.2.10 to_kdf_id()

```
KDFID filevault::core::FileFormatHandler::to_kdf_id (
    KDFType type) [static]
```

Convert [KDFType](#) to [KDFID](#).

Here is the caller graph for this function:

9.44.2.11 write_file()

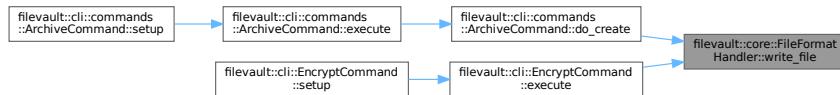

```
bool filevault::core::FileFormatHandler::write_file (
    const std::string & path,
    const FileHeader & header,
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > auth_tag) [static]
```

Write encrypted file with header.

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- include/filevault/core/file_format.hpp
- src/format/file_format.cpp

9.45 filevault::core::FileHeader Struct Reference

File format header.

```
#include <file_format.hpp>
```

Public Member Functions

9.45.1 Detailed Description

File format header.

9.45.2 Member Function Documentation

9.45.2.1 [deserialize\(\)](#)

```
std::pair< FileHeader, size_t > filevault::core::FileHeader::deserialize (
    std::span< const uint8_t > data) [static]
```

Deserialize header from bytes.

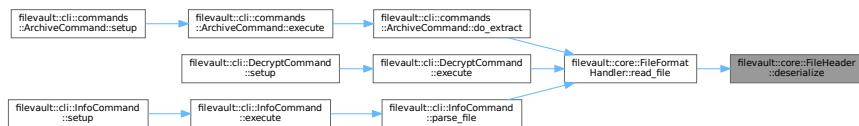

Returns

Header and number of bytes consumed

Here is the call graph for this function:

Here is the caller graph for this function:

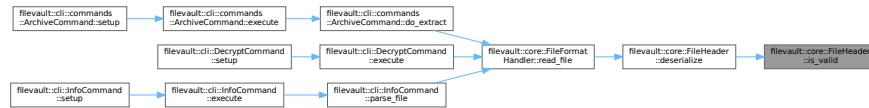

9.45.2.2 `is_valid()`

```
bool filevault::core::FileHeader::is_valid () const
```

Check if magic bytes are valid.

Here is the caller graph for this function:

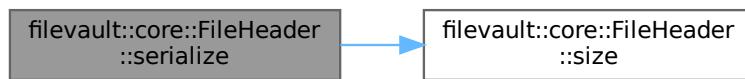

9.45.2.3 `serialize()`

```
std::vector< uint8_t > filevault::core::FileHeader::serialize () const
```

Serialize header to bytes.

Here is the call graph for this function:

Here is the caller graph for this function:

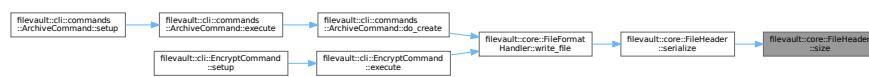

9.45.2.4 `size()`

```
size_t filevault::core::FileHeader::size () const
```

Get total header size in bytes.

Here is the caller graph for this function:

9.46.1 Detailed Description

FileVault encrypted file format.

Structure:

- Magic bytes (4): "FVLT"
- Version (2): major.minor
- Algorithm (1): AlgorithmType enum
- KDF (1): KDFType enum
- Security level (1): SecurityLevel enum
- Salt length (2): uint16_t
- Salt (variable)
- Nonce length (2): uint16_t
- Nonce (variable)
- Tag length (2): uint16_t
- Tag (variable, for AEAD)
- Original size (8): uint64_t
- Encrypted size (8): uint64_t
- Timestamp (8): uint64_t (Unix epoch)
- Flags (4): compression, etc.
- Reserved (16): future use
- Encrypted data (variable)

9.48.2.3 read_file()

```
core::Result< std::vector< uint8_t > > filevault::utils::FileIO::read_file (
    const std::string & path) [static]
```

Read entire file into memory.

Here is the caller graph for this function:

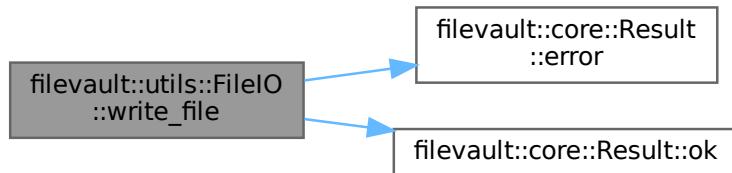

9.48.2.4 write_file()

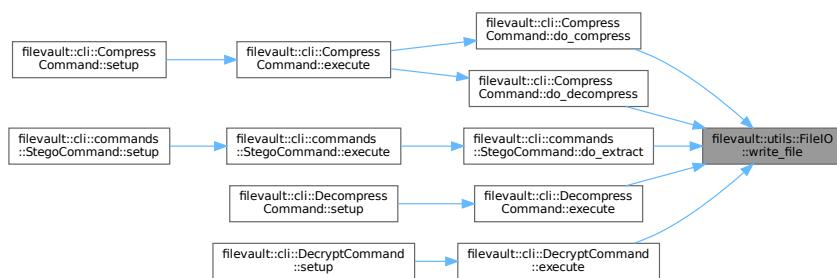

```
core::Result< void > filevault::utils::FileIO::write_file (
    const std::string & path,
    std::span< const uint8_t > data) [static]
```

Write data to file.

Here is the call graph for this function:

Here is the caller graph for this function:

9.49.1 Detailed Description

Hash command - Calculate cryptographic hashes.

Supports: MD5, SHA1, SHA2 family (224/256/384/512), SHA3 family (224/256/384/512), BLAKE2 (b/s variants)

Features:

- HMAC mode with key
- Hash verification
- Batch processing
- Performance benchmarking

9.49.2 Constructor & Destructor Documentation**9.49.2.1 HashCommand()**

```
filevault::cli::HashCommand::HashCommand (
    core::CryptoEngine & engine) [explicit]

9.53 filevault::compression::ICompressor Class Reference

Interface for compression algorithms.

```
#include <compressor.hpp>
```

Inheritance diagram for filevault::compression::ICompressor:

Public Member Functions

- virtual `~ICompressor ()=default`
- virtual std::string `name () const =0`
Get compressor name.
- virtual `CompressionResult compress (std::span< const uint8_t > input, int level=6)=0`
Compress data.
- virtual `CompressionResult decompress (std::span< const uint8_t > input)=0`
Decompress data.

9.53.1 Detailed Description

Interface for compression algorithms.

9.53.2 Constructor & Destructor Documentation

9.53.2.1 `~ICompressor()`

```
virtual filevault::compression::ICompressor::~ICompressor () [virtual], [default]
```

9.53.3 Member Function Documentation

9.53.3.1 `compress()`

```
virtual CompressionResult filevault::compression::ICompressor::compress (
    std::span< const uint8_t > input,
    int level = 6) [pure virtual]
```

Compress data.

Parameters

<code>input</code>	Data to compress
<code>level</code>	Compression level (1-9, algorithm-specific)

Returns

Compressed data

Implemented in [filevault::compression::Bzip2Compressor](#), [filevault::compression::LzmaCompressor](#), and [filevault::compression::ZlibCompressor](#).

9.53.3.2 decompress()

```
virtual CompressionResult filevault::compression::ICompressor::decompress (
    std::span< const uint8_t > input) [pure virtual]
```

Decompress data.

Parameters

<i>input</i>	Compressed data
--------------	-----------------

Returns

Decompressed data

Implemented in [filevault::compression::Bzip2Compressor](#), [filevault::compression::LzmaCompressor](#), and [filevault::compression::ZlibCompressor](#).

9.53.3.3 name()

```
virtual std::string filevault::compression::ICompressor::name () const [pure virtual]
```

Get compressor name.

Implemented in [filevault::compression::Bzip2Compressor](#), [filevault::compression::LzmaCompressor](#), and [filevault::compression::ZlibCompressor](#).

The documentation for this class was generated from the following file:

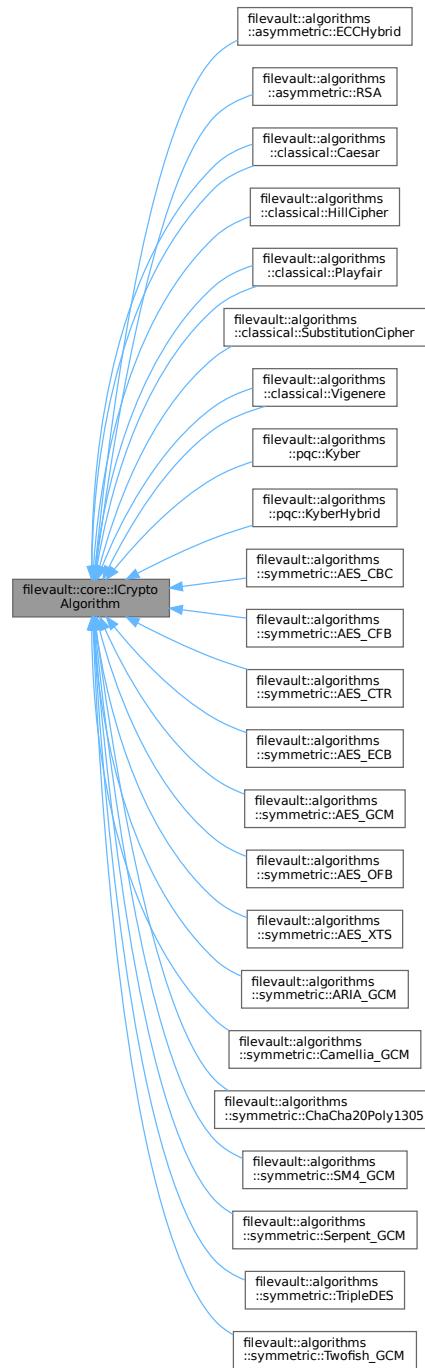

- include/filevault/compression/compressor.hpp

9.54 filevault::core::ICryptoAlgorithm Class Reference

Interface for cryptographic algorithms.

```
#include <crypto_algorithm.hpp>
```

Inheritance diagram for filevault::core::ICryptoAlgorithm:

Public Member Functions

- virtual [~ICryptoAlgorithm \(\)=default](#)
- virtual std::string [name \(\) const =0](#)

Get algorithm name.

- virtual [AlgorithmType type \(\) const =0](#)

Get algorithm type.

- virtual `CryptoResult encrypt (std::span< const uint8_t > plaintext, std::span< const uint8_t > key, const EncryptionConfig &config)=0`
Encrypt data.
- virtual `CryptoResult decrypt (std::span< const uint8_t > ciphertext, std::span< const uint8_t > key, const EncryptionConfig &config)=0`
Decrypt data.
- virtual `size_t key_size () const =0`
Get recommended key size in bytes.
- virtual `bool is Suitable_for (SecurityLevel level) const =0`
Check if algorithm is suitable for security level.

9.54.1 Detailed Description

Interface for cryptographic algorithms.

9.54.2 Constructor & Destructor Documentation

9.54.2.1 `~ICryptoAlgorithm()`

```
virtual filevault::core::ICryptoAlgorithm::~ICryptoAlgorithm () [virtual], [default]
```

9.54.3 Member Function Documentation

9.54.3.1 `decrypt()`

```
virtual CryptoResult filevault::core::ICryptoAlgorithm::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const EncryptionConfig & config) [pure virtual]
```

Decrypt data.

Parameters

<code>ciphertext</code>	Encrypted data
<code>key</code>	Decryption key (derived from password)
<code>config</code>	Decryption configuration

Returns

Decrypted data

Implemented in `filevault::algorithms::asymmetric::ECCHybrid`, `filevault::algorithms::asymmetric::RSA`, `filevault::algorithms::classical::filevault::algorithms::classical::Caesar`, `filevault::algorithms::classical::HillCipher`, `filevault::algorithms::classical::Playfair`, `filevault::algorithms::classical::Playfair`, `filevault::algorithms::classical::SubstitutionCipher`, `filevault::algorithms::classical::Vigenere`, `filevault::algorithms::classical::Vigenere`, `filevault::algorithms::pqc::Kyber`, `filevault::algorithms::pqc::KyberHybrid`, `filevault::algorithms::symmetric::AES_CBC`, `filevault::algorithms::symmetric::AES_CFB`, `filevault::algorithms::symmetric::AES_CTR`, `filevault::algorithms::symmetric::AES_ECB`, `filevault::algorithms::symmetric::AES_GCM`, `filevault::algorithms::symmetric::AES_OFB`, `filevault::algorithms::symmetric::AES_XTS`, `filevault::algorithms::symmetric::ARIA_GCM`, `filevault::algorithms::symmetric::Camellia_GCM`, `filevault::algorithms::symmetric::ChaCha20Poly1305`, `filevault::algorithms::symmetric::Serpent_GCM`, `filevault::algorithms::symmetric::filevault::algorithms::symmetric::TripleDES`, and `filevault::algorithms::symmetric::Twofish_GCM`.

9.54.3.2 `encrypt()`

```
virtual CryptoResult filevault::core::ICryptoAlgorithm::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const EncryptionConfig & config) [pure virtual]
```

Encrypt data.

Parameters

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implemented in [filevault::algorithms::asymmetric::ECCHybrid](#), [filevault::algorithms::asymmetric::RSA](#), [filevault::algorithms::classical::filevault::algorithms::classical::Caesar](#), [filevault::algorithms::classical::HillCipher](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::SubstitutionCipher](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::pqc::Kyber](#), [filevault::algorithms::pqc::KyberHybrid](#), [filevault::algorithms::symmetric::AES_CBC](#), [filevault::algorithms::symmetric::AES_CFB](#), [filevault::algorithms::symmetric::AES_CTR](#), [filevault::algorithms::symmetric::AES_ECB](#), [filevault::algorithms::symmetric::AES_GCM](#), [filevault::algorithms::symmetric::AES_OFB](#), [filevault::algorithms::symmetric::AES_XTS](#), [filevault::algorithms::symmetric::ARIA_GCM](#), [filevault::algorithms::symmetric::Camellia_G](#), [filevault::algorithms::symmetric::ChaCha20Poly1305](#), [filevault::algorithms::symmetric::Serpent_GCM](#), [filevault::algorithms::symmetric::Twofish_GCM](#), [filevault::algorithms::symmetric::TripleDES](#), and [filevault::algorithms::symmetric::Twofish_GCM](#).

9.54.3.3 is_suitable_for()

```
virtual bool filevault::core::ICryptoAlgorithm::is_suitable_for (
    SecurityLevel level) const [pure virtual]
```

Check if algorithm is suitable for security level.

Implemented in [filevault::algorithms::asymmetric::ECCHybrid](#), [filevault::algorithms::asymmetric::RSA](#), [filevault::algorithms::classical::filevault::algorithms::classical::Caesar](#), [filevault::algorithms::classical::HillCipher](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::SubstitutionCipher](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::pqc::Kyber](#), [filevault::algorithms::pqc::KyberHybrid](#), [filevault::algorithms::symmetric::AES_CBC](#), [filevault::algorithms::symmetric::AES_CFB](#), [filevault::algorithms::symmetric::AES_CTR](#), [filevault::algorithms::symmetric::AES_ECB](#), [filevault::algorithms::symmetric::AES_GCM](#), [filevault::algorithms::symmetric::AES_OFB](#), [filevault::algorithms::symmetric::AES_XTS](#), [filevault::algorithms::symmetric::ARIA_GCM](#), [filevault::algorithms::symmetric::Camellia_G](#), [filevault::algorithms::symmetric::ChaCha20Poly1305](#), [filevault::algorithms::symmetric::Serpent_GCM](#), [filevault::algorithms::symmetric::Twofish_GCM](#), [filevault::algorithms::symmetric::TripleDES](#), and [filevault::algorithms::symmetric::Twofish_GCM](#).

9.54.3.4 key_size()

```
virtual size_t filevault::core::ICryptoAlgorithm::key_size () const [pure virtual]
```

Get recommended key size in bytes.

Implemented in [filevault::algorithms::asymmetric::ECCHybrid](#), [filevault::algorithms::asymmetric::RSA](#), [filevault::algorithms::classical::filevault::algorithms::classical::Caesar](#), [filevault::algorithms::classical::HillCipher](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::SubstitutionCipher](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::pqc::Kyber](#), [filevault::algorithms::pqc::KyberHybrid](#), [filevault::algorithms::symmetric::AES_CBC](#), [filevault::algorithms::symmetric::AES_CFB](#), [filevault::algorithms::symmetric::AES_CTR](#), [filevault::algorithms::symmetric::AES_ECB](#), [filevault::algorithms::symmetric::AES_GCM](#), [filevault::algorithms::symmetric::AES_OFB](#), [filevault::algorithms::symmetric::AES_XTS](#), [filevault::algorithms::symmetric::ARIA_GCM](#), [filevault::algorithms::symmetric::Camellia_G](#), [filevault::algorithms::symmetric::ChaCha20Poly1305](#), [filevault::algorithms::symmetric::Serpent_GCM](#), [filevault::algorithms::symmetric::Twofish_GCM](#), [filevault::algorithms::symmetric::TripleDES](#), and [filevault::algorithms::symmetric::Twofish_GCM](#).

9.54.3.5 name()

```
virtual std::string filevault::core::ICryptoAlgorithm::name () const [pure virtual]
```

Get algorithm name.

Implemented in [filevault::algorithms::asymmetric::ECCHybrid](#), [filevault::algorithms::asymmetric::RSA](#), [filevault::algorithms::classical::filevault::algorithms::classical::Caesar](#), [filevault::algorithms::classical::HillCipher](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::Playfair](#), [filevault::algorithms::classical::SubstitutionCipher](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::classical::Vigenere](#), [filevault::algorithms::pqc::Kyber](#), [filevault::algorithms::pqc::KyberHybrid](#), [filevault::algorithms::symmetric::AES_CBC](#), [filevault::algorithms::symmetric::AES_CFB](#), [filevault::algorithms::symmetric::AES_CTR](#), [filevault::algorithms::symmetric::AES_ECB](#), [filevault::algorithms::symmetric::AES_GCM](#), [filevault::algorithms::symmetric::AES_OFB](#), [filevault::algorithms::symmetric::AES_XTS](#), [filevault::algorithms::symmetric::ARIA_GCM](#), [filevault::algorithms::symmetric::Camellia_G](#), [filevault::algorithms::symmetric::ChaCha20Poly1305](#), [filevault::algorithms::symmetric::Serpent_GCM](#), [filevault::algorithms::symmetric::Twofish_GCM](#).

`filevault::algorithms::symmetric::AES_ECB`, `filevault::algorithms::symmetric::AES_GCM`, `filevault::algorithms::symmetric::AES_OFB`, `filevault::algorithms::symmetric::AES_XTS`, `filevault::algorithms::symmetric::ARIA_GCM`, `filevault::algorithms::symmetric::Camellia_GCM`, `filevault::algorithms::symmetric::ChaCha20Poly1305`, `filevault::algorithms::symmetric::Serpent_GCM`, `filevault::algorithms::symmetric::Twofish_GCM`, `filevault::algorithms::symmetric::TripleDES`, and `filevault::algorithms::symmetric::Twofish_GCM`.

9.54.3.6 type()

```
virtual AlgorithmType filevault::core::ICryptoAlgorithm::type () const [pure virtual]
```

Get algorithm type.

Implemented in `filevault::algorithms::asymmetric::ECCHybrid`, `filevault::algorithms::asymmetric::RSA`, `filevault::algorithms::classical::Caesar`, `filevault::algorithms::classical::HillCipher`, `filevault::algorithms::classical::Playfair`, `filevault::algorithms::classical::Playfair`, `filevault::algorithms::classical::SubstitutionCipher`, `filevault::algorithms::classical::Vigenere`, `filevault::algorithms::classical::Vigenere`, `filevault::algorithms::pqc::Kyber`, `filevault::algorithms::pqc::KyberHybrid`, `filevault::algorithms::symmetric::AES_CBC`, `filevault::algorithms::symmetric::AES_CFB`, `filevault::algorithms::symmetric::AES_CTR`, `filevault::algorithms::symmetric::AES_ECB`, `filevault::algorithms::symmetric::AES_GCM`, `filevault::algorithms::symmetric::AES_OFB`, `filevault::algorithms::symmetric::AES_XTS`, `filevault::algorithms::symmetric::ARIA_GCM`, `filevault::algorithms::symmetric::Camellia_GCM`, `filevault::algorithms::symmetric::ChaCha20Poly1305`, `filevault::algorithms::symmetric::Serpent_GCM`, `filevault::algorithms::symmetric::Twofish_GCM`, `filevault::algorithms::symmetric::TripleDES`, and `filevault::algorithms::symmetric::Twofish_GCM`.

9.58.1 Detailed Description

[Kyber](#) Key Encapsulation Mechanism (KEM).

NIST FIPS 203 (ML-KEM) - Post-quantum secure key encapsulation

[Kyber](#) is a lattice-based KEM that provides:

- IND-CCA2 security
- Resistance to quantum computer attacks
- Efficient key generation, encapsulation, and decapsulation

Variants:

- Kyber-512: ~128-bit post-quantum security
- Kyber-768: ~192-bit post-quantum security (recommended)
- Kyber-1024: ~256-bit post-quantum security

filevault::algorithms::pqc::Kyber::~Kyber () [override], [default]
```

9.58.4 Member Function Documentation

9.58.4.1 ciphertext_size()

```
size_t filevault::algorithms::pqc::Kyber::ciphertext_size () const
Get ciphertext size for this variant.
```

9.58.4.2 decrypt()

```
core::CryptoResult filevault::algorithms::pqc::Kyber::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decapsulate: Recover shared secret from ciphertext.

Uses own private key to recover the shared secret.

Parameters

ciphertext	Encapsulated ciphertext
key	Own private key
config	Configuration

Returns

CryptoResult with shared secret in 'data'

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.58.4.3 encrypt()**

```
core::CryptoResult filevault::algorithms::pqc::Kyber::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encapsulate: Generate shared secret and ciphertext.

Uses recipient's public key to generate a shared secret and encapsulated ciphertext.

Parameters

<i>plaintext</i>	Not used (KEM doesn't encrypt directly)
<i>key</i>	Recipient's public key
<i>config</i>	Configuration

Returns

CryptoResult with encapsulated ciphertext and shared secret in 'data'

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Here is the caller graph for this function:

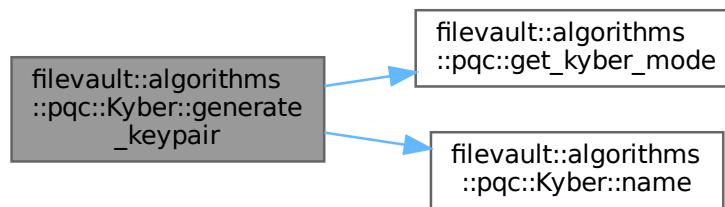

9.58.4.4 generate_keypair()

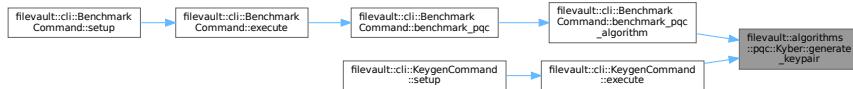

`PQKeyPair` `filevault::algorithms::pqc::Kyber::generate_keypair ()`

Generate `Kyber` key pair.

Here is the call graph for this function:

Here is the caller graph for this function:

9.58.4.5 is_suitable_for()

`bool` `filevault::algorithms::pqc::Kyber::is_suitable_for (core::SecurityLevel level) const [override], [virtual]`

Check if algorithm is suitable for security level.

Implements `filevault::core::ICryptoAlgorithm`.

9.58.4.6 key_size()

`size_t` `filevault::algorithms::pqc::Kyber::key_size () const [override], [virtual]`

Get recommended key size in bytes.

Implements `filevault::core::ICryptoAlgorithm`.

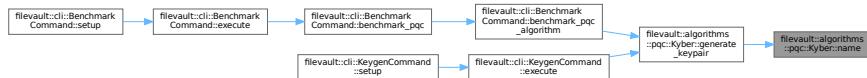

9.58.4.7 name()

`std::string` `filevault::algorithms::pqc::Kyber::name () const [override], [virtual]`

Get algorithm name.

Implements `filevault::core::ICryptoAlgorithm`.

Here is the caller graph for this function:

9.58.4.8 private_key_size()

```
size_t filevault::algorithms::pqc::Kyber::private_key_size () const
Get private key size for this variant.
```

9.58.4.9 public_key_size()

```
size_t filevault::algorithms::pqc::Kyber::public_key_size () const
Get public key size for this variant.
```

9.58.4.10 shared_secret_size()

```
size_t filevault::algorithms::pqc::Kyber::shared_secret_size () const [inline]
Get shared secret size (always 32 bytes).
```

9.58.4.11 type()

```
core::AlgorithmType filevault::algorithms::pqc::Kyber::type () const [override], [virtual]
Get algorithm type.
Implements filevault::core::ICryptoAlgorithm.

Private Attributes

- `Kyber kyber_`

9.59.1 Detailed Description

Hybrid encryption combining [Kyber](#) with AES-GCM.

This provides defense-in-depth by combining:

- [Kyber](#) for post-quantum secure key encapsulation
- AES-256-GCM for symmetric encryption

Even if one algorithm is broken, the other provides protection.

9.59.2 Constructor & Destructor Documentation

9.59.2.1 KyberHybrid()

```
filevault::algorithms::pqc::KyberHybrid::KyberHybrid (
    Kyber::Variant variant = Kyber::Variant::Kyber768) [explicit]
```

9.59.2.2 ~KyberHybrid()

```
filevault::algorithms::pqc::KyberHybrid::~KyberHybrid () [override], [default]
```

9.59.3 Member Function Documentation

9.59.3.1 decrypt()

```
core::CryptoResult filevault::algorithms::pqc::KyberHybrid::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data using Kyber+AES-GCM hybrid.

1. Decapsulate [Kyber](#) ciphertext to get shared secret
2. Use shared secret as AES key
3. Decrypt data with AES-256-GCM

Parameters

<code>ciphertext</code>	Encrypted data
<code>key</code>	Own Kyber private key

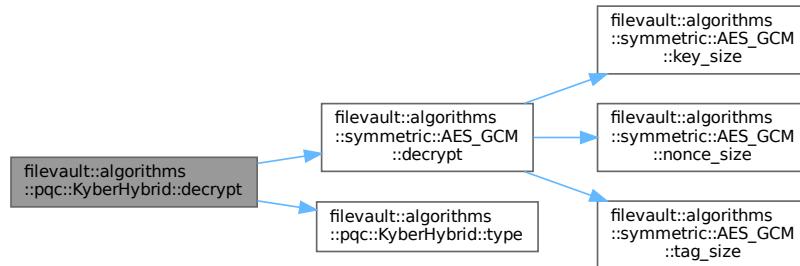

<i>config</i>	Configuration
---------------	---------------

Returns

Decrypted plaintext

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.59.3.2 encrypt()**

```

core::CryptoResult filevault::algorithms::pqc::KyberHybrid::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
  
```

Encrypt data using Kyber+AES-GCM hybrid.

1. Encapsulate with **Kyber** to get shared secret
2. Use shared secret as AES key
3. Encrypt data with AES-256-GCM

Parameters

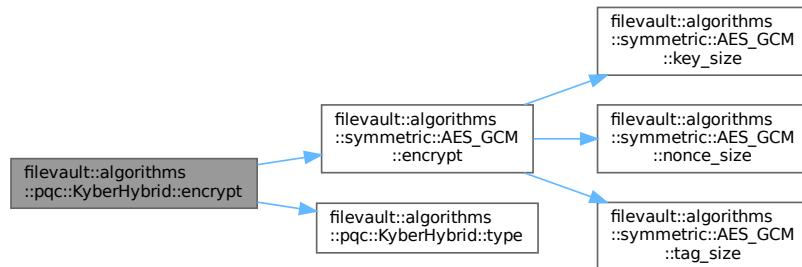

<i>plaintext</i>	Data to encrypt
<i>key</i>	Recipient's Kyber public key
<i>config</i>	Configuration

Returns

Ciphertext containing [Kyber](#) ciphertext + AES ciphertext

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.59.3.3 generate_keypair()**

[PQKeyPair](#) `filevault::algorithms::pqc::KyberHybrid::generate_keypair ()`

Generate hybrid key pair.

9.61 filevault::steganography::LSBSteganography Class Reference

LSB (Least Significant Bit) Steganography.

```
#include <lsb.hpp>
```

Static Public Member Functions

- static bool [embed](#) (const std::string &cover_image_path, std::span< const uint8_t > secret_data, const std::string &output_path, int bits_per_channel=1)
Embed secret data into image.
- static std::vector< uint8_t > [extract](#) (const std::string &stego_image_path, int bits_per_channel=1)
Extract hidden data from stego image.
- static size_t [calculate_capacity](#) (const std::string &image_path, int bits_per_channel=1)
Calculate maximum capacity for given image.

Static Private Member Functions

- static void [embed_byte](#) (uint8_t *pixel_data, size_t pixel_count, size_t &bit_index, uint8_t byte, int bits_per_channel)
- static uint8_t [extract_byte](#) (const uint8_t *pixel_data, size_t pixel_count, size_t &bit_index, int bits_per_channel)

Static Private Attributes

- static constexpr size_t [LENGTH_HEADER_SIZE](#) = 4

9.61.1 Detailed Description

LSB (Least Significant Bit) Steganography.

Embeds secret data into image pixels by modifying the least significant bits. Supports PNG and BMP images.

Capacity: For RGB images, ~3 bits per pixel (if using 1 bit per channel) For an 800x600 image: $(800 * 600 * 3) / 8 = 180,000$ bytes max

9.61.2 Member Function Documentation

9.61.2.1 calculate_capacity()

```
size_t filevault::steganography::LSBSteganography::calculate_capacity (
    const std::string & image_path,
    int bits_per_channel = 1) [static]
```

Calculate maximum capacity for given image.

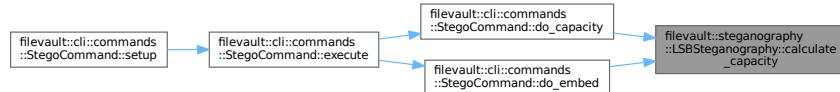

Parameters

<code>image_path</code>	Path to image
<code>bits_per_channel</code>	Number of LSBs per channel

Returns

Maximum bytes that can be hidden, or 0 on error

Here is the caller graph for this function:

**9.61.2.2 embed()**

```
bool filevault::steganography::LSBSteganography::embed (
    const std::string & cover_image_path,
    std::span< const uint8_t > secret_data,
    const std::string & output_path,
    int bits_per_channel = 1) [static]
```

Embed secret data into image.

Parameters

<i>cover_image_path</i>	Path to cover image (PNG/BMP)
<i>secret_data</i>	Data to hide
<i>output_path</i>	Path for output stego image
<i>bits_per_channel</i>	Number of LSBs to use per color channel (1-4, default 1)

Returns

true if successful, false otherwise

Here is the call graph for this function:

Here is the caller graph for this function:

**9.61.2.3 embed_byte()**

```
void filevault::steganography::LSBSteganography::embed_byte (
    uint8_t * pixel_data,
```

```
size_t pixel_count,
size_t & bit_index,
uint8_t byte,
int bits_per_channel) [static], [private]
```

Here is the caller graph for this function:

9.61.2.4 extract()

```
std::vector< uint8_t > filevault::steganography::LSBSteganography::extract (
    const std::string & stego_image_path,
    int bits_per_channel = 1) [static]
```

Extract hidden data from stego image.

Parameters

<i>stego_image_path</i>	Path to stego image
<i>bits_per_channel</i>	Number of LSBs used per color channel (must match embed)

Returns

Extracted secret data, or empty vector on failure

Here is the call graph for this function:

Here is the caller graph for this function:

9.61.2.5 extract_byte()

```
uint8_t filevault::steganography::LSBSteganography::extract_byte (
    const uint8_t * pixel_data,
    size_t pixel_count,
    size_t & bit_index,
    int bits_per_channel) [static], [private]
```

Here is the caller graph for this function:

9.61.3 Member Data Documentation

9.61.3.1 LENGTH_HEADER_SIZE

`size_t filevault::steganography::LSBSteganography::LENGTH_HEADER_SIZE = 4 [static], [constexpr], [private]`

9.62 filevault::compression::LzmaCompressor Class Reference

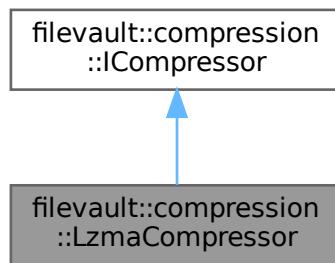

LZMA compressor (maximum compression, slowest).

#include <compression.hpp>

Inheritance diagram for filevault::compression::LzmaCompressor:

Collaboration diagram for filevault::compression::LzmaCompressor:

Public Member Functions

- std::string **name** () const override
Get compressor name.
- **CompressionResult compress** (std::span< const uint8_t > *input*, int *level*=6) override
Compress data.
- **CompressionResult decompress** (std::span< const uint8_t > *input*) override
Decompress data.

Public Member Functions inherited from [filevault::compression::ICompressor](#)

- virtual ~[ICompressor](#) ()=default

9.62.1 Detailed Description

LZMA compressor (maximum compression, slowest).

9.62.2 Member Function Documentation**9.62.2.1 compress()**

```
CompressionResult filevault::compression::LzmaCompressor::compress (
    std::span< const uint8_t > input,
    int level = 6) [override], [virtual]
```

Compress data.

Parameters

<i>input</i>	Data to compress
<i>level</i>	Compression level (1-9, algorithm-specific)

Returns

Compressed data

Implements [filevault::compression::ICompressor](#).

9.62.2.2 decompress()

```
CompressionResult filevault::compression::LzmaCompressor::decompress (
    std::span< const uint8_t > input) [override], [virtual]
```

Decompress data.

Parameters

<i>input</i>	Compressed data
--------------	-----------------

Returns

Decompressed data

Implements [filevault::compression::ICompressor](#).

9.62.2.3 name()

```
std::string filevault::compression::LzmaCompressor::name () const [inline], [override], [virtual]
Get compressor name.
```

Implements [filevault::compression::ICompressor](#).

The documentation for this class was generated from the following files:

9.64 filevault::utils::Password Class Reference

`Password` utilities for secure input and strength analysis.

```
#include <password.hpp>
```

Static Public Member Functions

- static std::string `read_secure` (const std::string &prompt="Password: ", bool confirm=false)
Read password from terminal with masking.
- static core::PasswordAnalysis `analyze_strength` (const std::string &password)
Analyze password strength.
- static std::string `get_strength_color` (core::PasswordStrength strength)
Get strength color for display.
- static std::string `get_strength_label` (core::PasswordStrength strength)
Get strength label.
- static void `display_strength_meter` (const core::PasswordAnalysis &analysis)
Display password strength meter.

Static Private Member Functions

- static void `disable_echo` ()
Platform-specific: Disable terminal echo.
- static void `enable_echo` ()
Platform-specific: Enable terminal echo.
- static bool `is_common_password` (const std::string &password)
Check if password is in common password list.
- static double `calculate_entropy` (const std::string &password)
Calculate password entropy.
- static std::pair< std::string, std::string > `estimate_crack_time` (double entropy, const core::PasswordAnalysis &analysis)
Estimate crack time.

Static Private Attributes

- static const std::vector< std::string > `common_passwords_`

9.64.1 Detailed Description

`Password` utilities for secure input and strength analysis.

9.64.2 Member Function Documentation

9.64.2.1 analyze_strength()

```
core::PasswordAnalysis filevault::utils::Password::analyze_strength (
    const std::string & password) [static]
```

Analyze password strength.

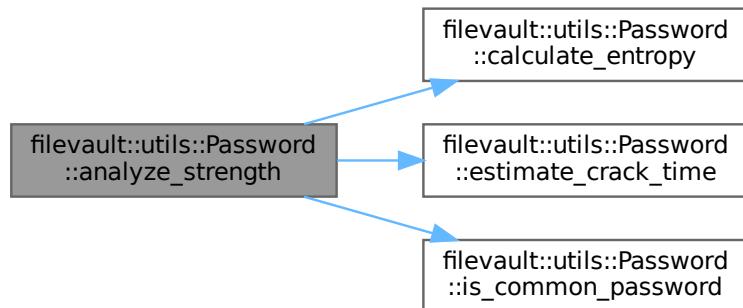

Parameters

<code>password</code>	Password to analyze
-----------------------	---------------------

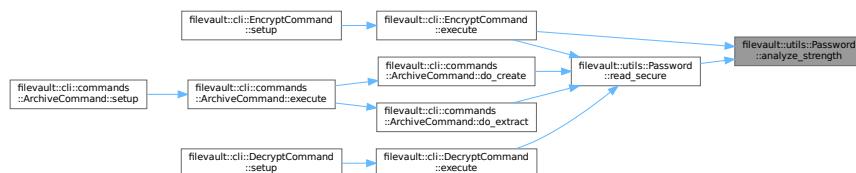

Returns

Detailed analysis with score and recommendations

Here is the call graph for this function:

Here is the caller graph for this function:

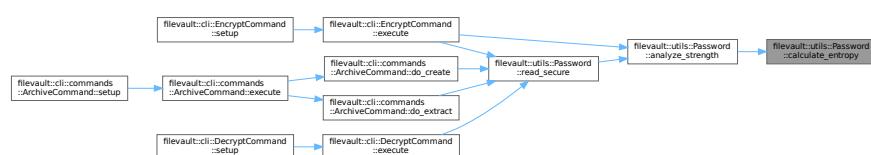

9.64.2.2 calculate_entropy()

```
double filevault::utils::Password::calculate_entropy (
    const std::string & password) [static], [private]
```

Calculate password entropy.

```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.67.3.10 is_suitable_for() [2/2]

```
bool filevault::algorithms::classical::Playfair::is_suitable_for (
    core::SecurityLevel level) const [inline], [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.67.3.11 key_size() [1/2]

```
size_t filevault::algorithms::classical::Playfair::key_size () const [inline], [override],
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

9.67.3.12 key_size() [2/2]

```
size_t filevault::algorithms::classical::Playfair::key_size () const [inline], [override],
[virtual]
```

Get recommended key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

9.67.3.13 name() [1/2]

```
std::string filevault::algorithms::classical::Playfair::name () const [inline], [override],
[virtual]
```

Get algorithm name.

Implements [filevault::core::ICryptoAlgorithm](#).

9.67.3.14 name() [2/2]

```
std::string filevault::algorithms::classical::Playfair::name () const [inline], [override],  
[virtual]
```

Get algorithm name.

Implements [filevault::core::ICryptoAlgorithm](#).

9.67.3.15 type() [1/2]

```
core::AlgorithmType filevault::algorithms::classical::Playfair::type () const [inline], [override],  
[virtual]
```

Get algorithm type.

Implements [filevault::core::ICryptoAlgorithm](#).

9.67.3.16 type() [2/2]

```
core::AlgorithmType filevault::algorithms::classical::Playfair::type () const [inline], [override],  
[virtual]
```

Get algorithm type.

Implements [filevault::core::ICryptoAlgorithm](#).

Verify signature with public key.
- size_t [key_size](#) () const override
Get recommended key size in bytes.
- size_t [max_plaintext_size](#) () const
*Maximum plaintext size that can be encrypted For OAEP with SHA-256: key_bytes - 2*hash_len - 2 = key_bytes - 66.*
- bool [requires_padding](#) () const
- bool [is_authenticated](#) () const
- bool [is_suitable_for](#) (core::SecurityLevel level) const override
Check if algorithm is suitable for security level.

Public Member Functions inherited from [filevault::core::ICryptoAlgorithm](#)

- virtual ~[ICryptoAlgorithm](#) ()=default

Private Attributes

- size_t [key_bits_](#)
- core::AlgorithmType [type_](#)

9.73.1 Detailed Description

[RSA](#) asymmetric encryption algorithm.

Features:

- Public key encryption, private key decryption
- Key sizes: 2048, 3072, 4096 bits
- OAEP padding (PKCS#1 v2.1) for encryption
- PSS padding for signatures

Note: [RSA](#) encrypts limited data (key_size - padding overhead). For large data, use hybrid encryption ([RSA](#) + symmetric cipher).

9.73.2 Constructor & Destructor Documentation

9.73.2.1 RSA()

```
filevault::algorithms::asymmetric::RSA::RSA (
    size_t key_bits = 2048) [explicit]
```

Construct [RSA](#) with specified key size.

Parameters

<code>key_bits</code>	Key size in bits (2048, 3072, or 4096)
-----------------------	--

9.73.2.2 ~RSA()

```
filevault::algorithms::asymmetric::RSA::~RSA () [override], [default]
```

9.73.3 Member Function Documentation

9.73.3.1 decrypt()

```
core::CryptoResult filevault::algorithms::asymmetric::RSA::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt with private key.

Parameters

<i>ciphertext</i>	Data to decrypt
<i>key</i>	Private key (PEM or DER encoded)
<i>config</i>	Encryption configuration

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.73.3.2 encrypt()

```
core::CryptoResult filevault::algorithms::asymmetric::RSA::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

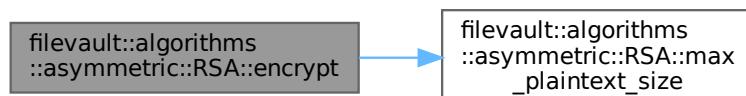

Encrypt with public key.

Parameters

<i>plaintext</i>	Data to encrypt (limited by key size)
<i>key</i>	Public key (PEM or DER encoded)
<i>config</i>	Encryption configuration

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Here is the caller graph for this function:

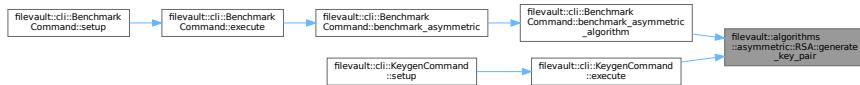

9.73.3.3 generate_key_pair()

`RSAKeyPair` `filevault::algorithms::asymmetric::RSA::generate_key_pair ()`
Generate a new RSA key pair.

Returns

`RSAKeyPair` containing public and private keys

Here is the caller graph for this function:

9.73.3.4 is_authenticated()

`bool filevault::algorithms::asymmetric::RSA::is_authenticated () const [inline]`

9.73.3.5 is_suitable_for()

`bool filevault::algorithms::asymmetric::RSA::is_suitable_for (core::SecurityLevel level) const [override], [virtual]`

Check if algorithm is suitable for security level.

Implements `filevault::core::ICryptoAlgorithm`.

9.73.3.6 key_size()

`size_t filevault::algorithms::asymmetric::RSA::key_size () const [inline], [override], [virtual]`
Get recommended key size in bytes.

Implements `filevault::core::ICryptoAlgorithm`.

9.73.3.7 max_plaintext_size()

`size_t filevault::algorithms::asymmetric::RSA::max_plaintext_size () const [inline]`
Maximum plaintext size that can be encrypted For OAEP with SHA-256: $\text{key_bytes} - 2*\text{hash_len} - 2 = \text{key_bytes} - 66$.

Here is the caller graph for this function:

9.73.3.8 name()

```
std::string filevault::algorithms::asymmetric::RSA::name () const [override], [virtual]
Get algorithm name.
```

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.73.3.9 requires_padding()

```
bool filevault::algorithms::asymmetric::RSA::requires_padding () const [inline]
```

9.73.3.10 sign()

```
std::vector< uint8_t > filevault::algorithms::asymmetric::RSA::sign (
    std::span< const uint8_t > data,
    std::span< const uint8_t > private_key)
```

Sign data with private key.

Parameters

<i>data</i>	Data to sign
<i>private_key</i>	Private key (PEM encoded)

Returns

Signature bytes

Here is the caller graph for this function:

9.73.3.11 type()

```
core::AlgorithmType filevault::algorithms::asymmetric::RSA::type () const [override], [virtual]
Get algorithm type.
```

Implements [filevault::core::ICryptoAlgorithm](#).

9.73.3.12 verify()

```
bool filevault::algorithms::asymmetric::RSA::verify (
    std::span< const uint8_t > data,
    std::span< const uint8_t > signature,
    std::span< const uint8_t > public_key)
```

Verify signature with public key.

Parameters

<i>data</i>	Original data
<i>signature</i>	Signature to verify
<i>public_key</i>	Public key (PEM encoded)

Returns

true if signature is valid

Here is the caller graph for this function:

Perform encryption/decryption operation.

9.76.1 Detailed Description

Serpent-256-GCM implementation.

Serpent is a 128-bit block cipher designed by Ross Anderson, Eli Biham, and Lars Knudsen. It was an AES finalist and is known for its high security margin.

References:

- Serpent: A Candidate Block Cipher for the AES <https://www.cl.cam.ac.uk/~rja14/serpent.html>
- NIST SP 800-38D: GCM Mode <https://nvlpubs.nist.gov/nistpubs/Legacy/SP/nistspecialpublications/NIST-SP-800-38D.pdf>

Security:

- Key size: 256 bits (32 bytes)
- Block size: 128 bits (16 bytes)
- Nonce size: 96 bits (12 bytes) for GCM
- Tag size: 128 bits (16 bytes) for authentication

Note

This implementation uses Botan's Serpent/GCM mode

Serpent-256 provides very high security margin

Slower than AES on most platforms but more secure

9.76.2 Constructor & Destructor Documentation

9.76.2.1 Serpent_GCM()

```
filevault::algorithms::symmetric::Serpent_GCM::Serpent_GCM ()
Construct Serpent-256-GCM cipher.
```

9.76.3 Member Function Documentation

9.76.3.1 decrypt()

```
core::CryptoResult filevault::algorithms::symmetric::Serpent_GCM::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt ciphertext with Serpent-256-GCM.

Parameters

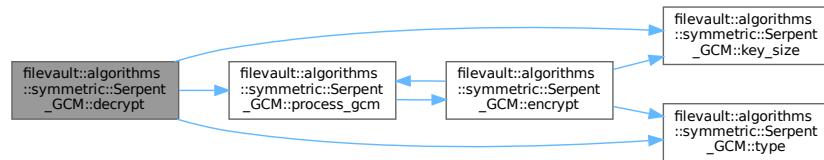

<i>ciphertext</i>	Encrypted data
<i>key</i>	256-bit decryption key
<i>config</i>	Decryption configuration with nonce and tag

Returns

Decrypted plaintext

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

9.76.3.2 encrypt()

```
core::CryptoResult filevault::algorithms::symmetric::Serpent_GCM::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt plaintext with Serpent-256-GCM.

Parameters

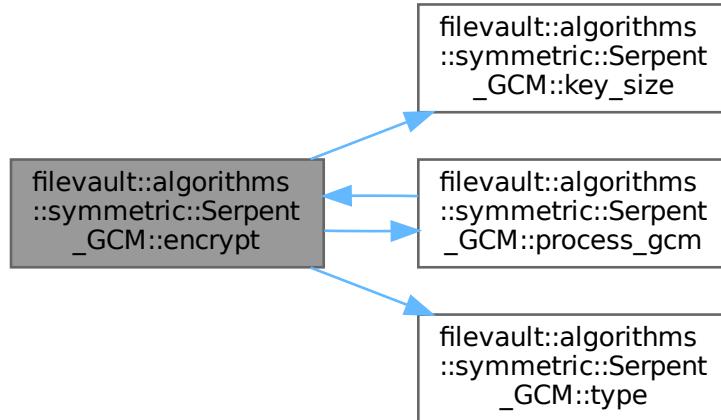

<i>plaintext</i>	Input data to encrypt
<i>key</i>	256-bit encryption key
<i>config</i>	Encryption configuration with nonce

Returns

Encrypted data with authentication tag

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.76.3.3 is_suitable_for()**

```
bool filevault::algorithms::symmetric::Serpent_GCM::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

Check if algorithm is suitable for security level.

Implements [filevault::core::ICryptoAlgorithm](#).

9.76.3.4 key_size()

```
size_t filevault::algorithms::symmetric::Serpent_GCM::key_size () const [override], [virtual]
```

Get required key size in bytes.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.76.3.5 name()

```
std::string filevault::algorithms::symmetric::Serpent_GCM::name () const [override], [virtual]
Get algorithm name.
Implements filevault::core::ICryptoAlgorithm.
```

9.76.3.6 process_gcm()

```
std::vector< uint8_t > filevault::algorithms::symmetric::Serpent_GCM::process_gcm (
    std::span< const uint8_t > input,
    std::span< const uint8_t > key,
    std::span< const uint8_t > nonce,
    std::span< const uint8_t > tag,
    bool encrypt) [private]
```

Perform encryption/decryption operation.

Parameters

<i>input</i>	Input data
<i>key</i>	Encryption/decryption key
<i>nonce</i>	Unique nonce (96 bits)
<i>tag</i>	Authentication tag (for decryption, empty for encryption)
<i>encrypt</i>	True for encryption, false for decryption

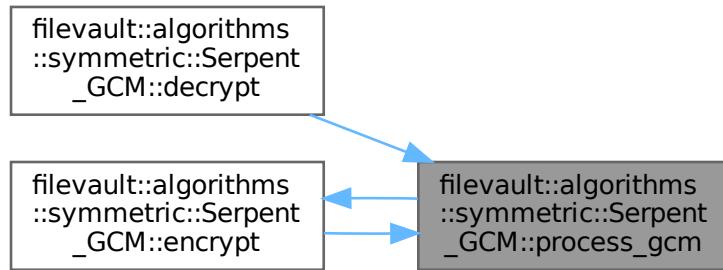

Returns

Encrypted/decrypted data (with tag appended for encryption)

Here is the call graph for this function:

Here is the caller graph for this function:

9.76.3.7 type()

```
core::AlgorithmType filevault::algorithms::symmetric::Serpent_GCM::type () const [override],  
[virtual]
```

Get algorithm type.

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.79.1 Detailed Description

SM4-GCM AEAD encryption.

SM4 only supports 128-bit keys. Uses GCM mode for authenticated encryption.

9.79.2 Constructor & Destructor Documentation

9.79.2.1 [SM4_GCM\(\)](#)

```
filevault::algorithms::symmetric::SM4_GCM::SM4_GCM ()
```

9.79.2.2 [~SM4_GCM\(\)](#)

```
virtual filevault::algorithms::symmetric::SM4_GCM::~SM4_GCM () [virtual], [default]
```

9.79.3 Member Function Documentation

9.79.3.1 [decrypt\(\)](#)

```
core::CryptoResult filevault::algorithms::symmetric::SM4_GCM::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

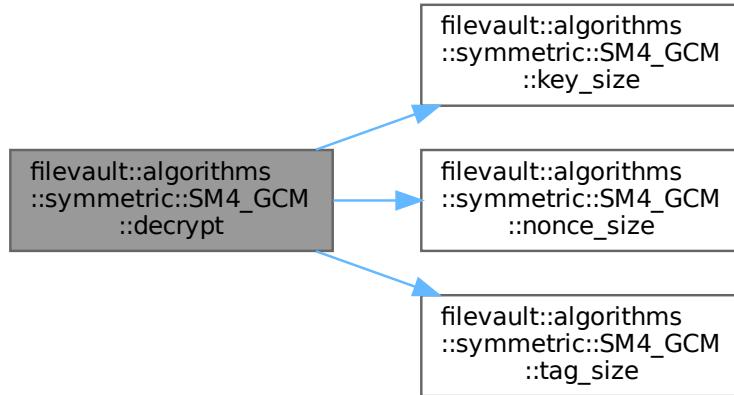

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.79.3.2 encrypt()**

```
core::CryptoResult filevault::algorithms::symmetric::SM4_GCM::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

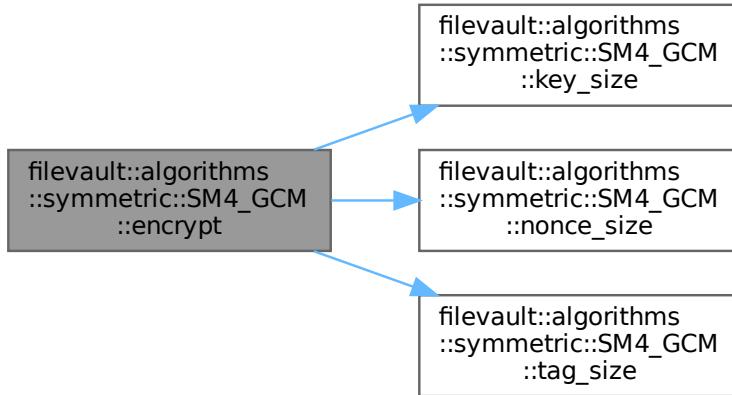

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.79.3.3 is_suitable_for()**

```
bool filevault::algorithms::symmetric::SM4_GCM::is_suitable_for (

- std::string `cover_image_`
- std::string `output_file_`
- int `bits_per_channel_ = 1`
- bool `verbose_ = false`

9.80.1 Detailed Description

Steganography command for embedding/extracting data in images.

Supports LSB (Least Significant Bit) steganography for hiding data within image files without visible changes.

Features:

- Embed secret data into PNG/BMP images
- Extract hidden data from stego images
- Calculate embedding capacity
- Configurable bits per channel (1-4)

9.80.2 Member Function Documentation

9.80.2.1 `description()`

```

- AlgorithmType `algorithm` = AlgorithmType::AES_256_GCM
- KDFType `kdf` = KDFType::ARGON2ID

- `SecurityLevel level = SecurityLevel::STRONG`
- `CompressionType compression = CompressionType::NONE`
- `int compression_level = 6`
- `StreamProgressCallback progress_callback = nullptr`

9.81.1 Detailed Description

Configuration for streaming encryption.

9.81.2 Member Data Documentation

9.81.2.1 algorithm

```
AlgorithmType filevault::core::StreamingConfig::algorithm = AlgorithmType::AES_256_GCM
```

9.81.2.2 chunk_size

```
size_t filevault::core::StreamingConfig::chunk_size = 64 * 1024 * 1024
```

9.81.2.3 compression

```
CompressionType filevault::core::StreamingConfig::compression = CompressionType::NONE
```

9.81.2.4 compression_level

```
int filevault::core::StreamingConfig::compression_level = 6
```

9.81.2.5 kdf

```
KDFType filevault::core::StreamingConfig::kdf = KDFType::ARGON2ID
```

9.81.2.6 level

```
SecurityLevel filevault::core::StreamingConfig::level = SecurityLevel::STRONG
```

9.81.2.7 progress_callback

```
StreamProgressCallback filevault::core::StreamingConfig::progress_callback = nullptr
```

The documentation for this struct was generated from the following file:

- include/filevault/core/streaming.hpp

9.82 filevault::core::StreamingCrypto Class Reference

Streaming encryption/decryption for large files.

```
#include <streaming.hpp>
```

Static Public Member Functions

- static `StreamingResult encrypt_file (const std::string &input_path, const std::string &output_path, const std::string &password, const StreamingConfig &config={})`
`Encrypt a large file using streaming.`
- static `StreamingResult decrypt_file (const std::string &input_path, const std::string &output_path, const std::string &password, StreamProgressCallback progress_callback=nullptr)`
`Decrypt a large file using streaming.`
- static `bool should_use_streaming (const std::string &file_path, size_t threshold=100 *1024 *1024)`
`Check if a file should use streaming (based on size).`
- static `size_t get_recommended_chunk_size ()`
`Get recommended chunk size based on available memory.`

Static Private Member Functions

- static std::vector< uint8_t > `derive_chunk_nonce` (const std::vector< uint8_t > &base_nonce, size_t chunk_index)
Derive chunk-specific nonce from base nonce and chunk index.
- static bool `write_stream_header` (std::ofstream &file, const `StreamingConfig` &config, const std::vector< uint8_t > &salt, const std::vector< uint8_t > &base_nonce, size_t total_size, size_t chunk_count)
Write streaming file header.
- static bool `read_stream_header` (std::ifstream &file, `StreamingConfig` &config, std::vector< uint8_t > &salt, std::vector< uint8_t > &base_nonce, size_t &original_size, size_t &chunk_count)
Read streaming file header.

9.82.1 Detailed Description

Streaming encryption/decryption for large files.

Uses chunk-based processing to handle files larger than available RAM. Each chunk is encrypted independently with a unique nonce derived from the base nonce and chunk index.

File format for streaming: [Header][Chunk1][Chunk2]...[ChunkN][Footer]

Each chunk: [4 bytes: chunk_size][12 bytes: nonce][encrypted_data][16 bytes: tag]

9.82.2 Member Function Documentation

9.82.2.1 `decrypt_file()`

```
StreamingResult filevault::core::StreamingCrypto::decrypt_file (
    const std::string & input_path,
    const std::string & output_path,
    const std::string & password,
    StreamProgressCallback progress_callback = nullptr)  [static]
```

Decrypt a large file using streaming.

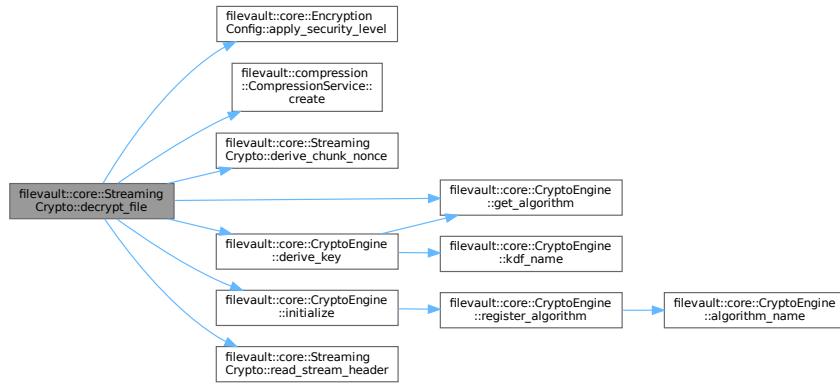

Parameters

<code>input_path</code>	Path to encrypted file
<code>output_path</code>	Path to output file
<code>password</code>	Decryption password
<code>progress_callback</code>	Optional progress callback

Returns

[Result](#) of the operation

Here is the call graph for this function:

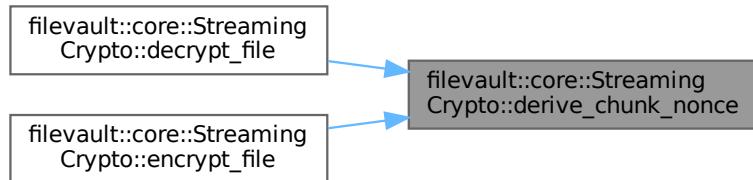

9.82.2.2 derive_chunk_nonce()

```
std::vector< uint8_t > filevault::core::StreamingCrypto::derive_chunk_nonce (
    const std::vector< uint8_t > & base_nonce,
    size_t chunk_index) [static], [private]
```

Derive chunk-specific nonce from base nonce and chunk index.

Here is the caller graph for this function:

9.82.2.3 encrypt_file()

```
StreamingResult filevault::core::StreamingCrypto::encrypt_file (
    const std::string & input_path,
    const std::string & output_path,
    const std::string & password,
    const StreamingConfig & config = {}) [static]
```

Encrypt a large file using streaming.

Parameters

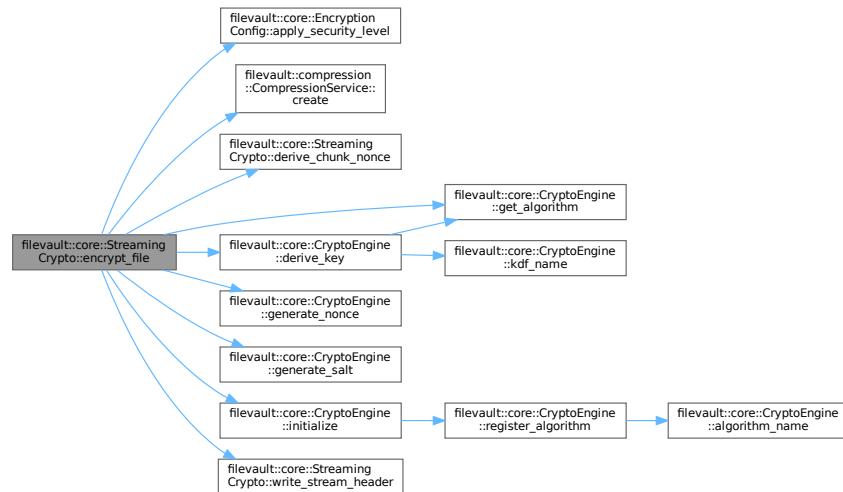

<i>input_path</i>	Path to input file
-------------------	--------------------

<i>output_path</i>	Path to output file
<i>password</i>	Encryption password
<i>config</i>	Streaming configuration

Returns

[Result](#) of the operation

Here is the call graph for this function:

**9.82.2.4 get_recommended_chunk_size()**

```
size_t filevault::core::StreamingCrypto::get_recommended_chunk_size () [static]
```

Get recommended chunk size based on available memory.

Returns

Recommended chunk size in bytes

9.82.2.5 read_stream_header()

```
bool filevault::core::StreamingCrypto::read_stream_header (
    std::ifstream & file,
    StreamingConfig & config,
    std::vector< uint8_t > & salt,
    std::vector< uint8_t > & base_nonce,
    size_t & original_size,
    size_t & chunk_count) [static], [private]
```

Read streaming file header.

Here is the caller graph for this function:

9.82.2.6 should_use_streaming()

```
bool filevault::core::StreamingCrypto::should_use_streaming (
    const std::string & file_path,
    size_t threshold = 100 * 1024 * 1024) [static]
```

Check if a file should use streaming (based on size).

Parameters

<i>file_path</i>	Path to file
<i>threshold</i>	Size threshold (default 100MB)

Returns

true if file is larger than threshold

9.82.2.7 write_stream_header()

```
bool filevault::core::StreamingCrypto::write_stream_header (
    std::ofstream & file,
    const StreamingConfig & config,
    const std::vector< uint8_t > & salt,
    const std::vector< uint8_t > & base_nonce,
    size_t total_size,
    size_t chunk_count) [static], [private]
```

Write streaming file header.

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

9.87.1 Detailed Description

Triple-DES (3DES/TDEA) encryption.

Uses three DES operations: Encrypt-Decrypt-Encrypt (EDE) 168-bit key (112 bits effective security) 64-bit block size

Warning

Legacy algorithm! Prefer AES for new applications. Block size of 64 bits is vulnerable to birthday attacks on large datasets (Sweet32 attack).

9.87.2 Constructor & Destructor Documentation

9.87.2.1 `TripleDES()`

```
filevault::algorithms::symmetric::TripleDES::TripleDES () [explicit]
```

    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt data.

Parameters

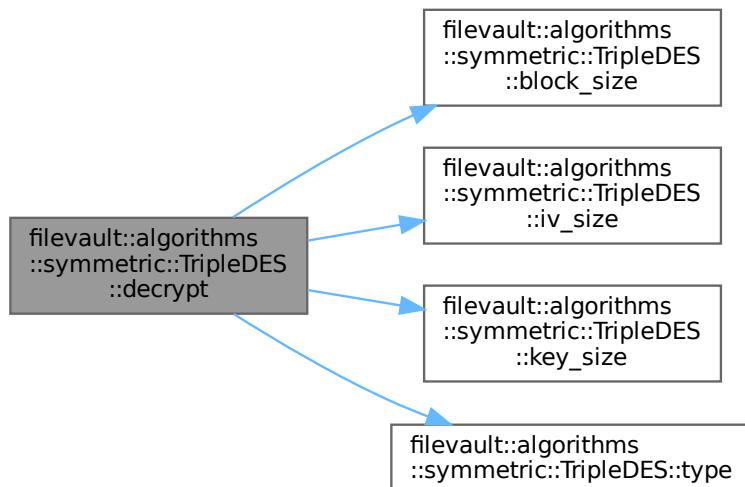

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (derived from password)
<i>config</i>	Decryption configuration

Returns

Decrypted data

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.87.3.3 encrypt()**

```
core::CryptoResult filevault::algorithms::symmetric::TripleDES::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt data.

Parameters

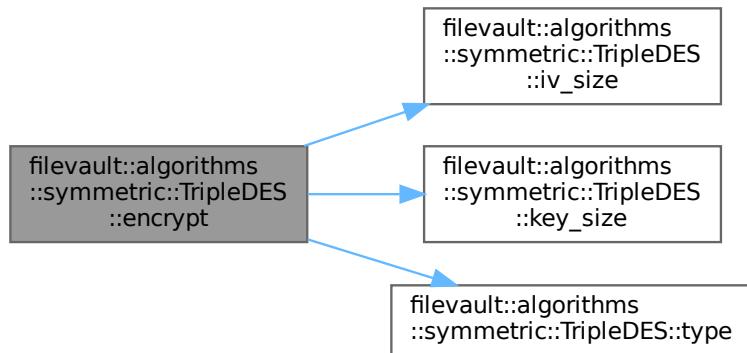

<i>plaintext</i>	Input data to encrypt
<i>key</i>	Encryption key (derived from password)
<i>config</i>	Encryption configuration

Returns

Encrypted data with metadata

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Perform encryption/decryption operation.

Private Attributes

- size_t `key_bits_`
- `core::AlgorithmType type_`
- std::string `botan_name_`

9.88.1 Detailed Description

Twofish-256-GCM implementation.

Twofish is a 128-bit block cipher designed by Bruce Schneier, John Kelsey, Doug Whiting, David Wagner, Chris Hall, and Niels Ferguson. It was an AES finalist and is known for its conservative design.

References:

- Twofish: A 128-Bit Block Cipher <https://www.schneier.com/academic/twofish/>
- NIST SP 800-38D: GCM Mode <https://nvlpubs.nist.gov/nistpubs/Legacy/SP/nistspecialpublicat.pdf>

Security:

- Key size: 256 bits (32 bytes)
- Block size: 128 bits (16 bytes)
- Nonce size: 96 bits (12 bytes) for GCM
- Tag size: 128 bits (16 bytes) for authentication

Features:

- Pre-computed S-boxes for performance
- Key-dependent S-boxes for security
- Supports 128, 192, and 256-bit keys
- Patent-free and royalty-free

Note

This implementation uses Botan's Twofish/GCM mode

Twofish-256 provides equivalent security to AES-256

9.88.2 Constructor & Destructor Documentation

9.88.2.1 `Twofish_GCM()`

```
filevault::algorithms::symmetric::Twofish_GCM::Twofish_GCM (
    Generated by Doxygen
    size_t key_bits = 256) [explicit]
Construct Twofish-256-GCM cipher.
```

Parameters

<i>key_bits</i>	Key size in bits (128, 192, or 256, default 256)
-----------------	--

9.88.3 Member Function Documentation**9.88.3.1 decrypt()**

```
core::CryptoResult filevault::algorithms::symmetric::Twofish_GCM::decrypt (
    std::span< const uint8_t > ciphertext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Decrypt ciphertext with Twofish-GCM.

Parameters

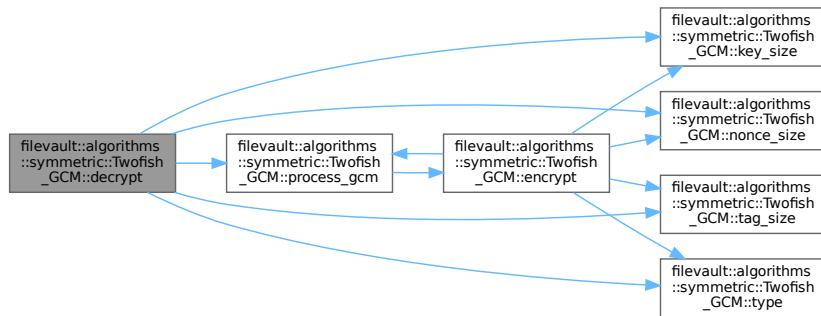

<i>ciphertext</i>	Encrypted data
<i>key</i>	Decryption key (size depends on <i>key_bits</i>)
<i>config</i>	Decryption configuration with nonce and tag

Returns

Decrypted plaintext

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

**9.88.3.2 encrypt()**

```
core::CryptoResult filevault::algorithms::symmetric::Twofish_GCM::encrypt (
    std::span< const uint8_t > plaintext,
    std::span< const uint8_t > key,
    const core::EncryptionConfig & config) [override], [virtual]
```

Encrypt plaintext with Twofish-GCM.

Parameters

<i>plaintext</i>	Input data to encrypt
------------------	-----------------------

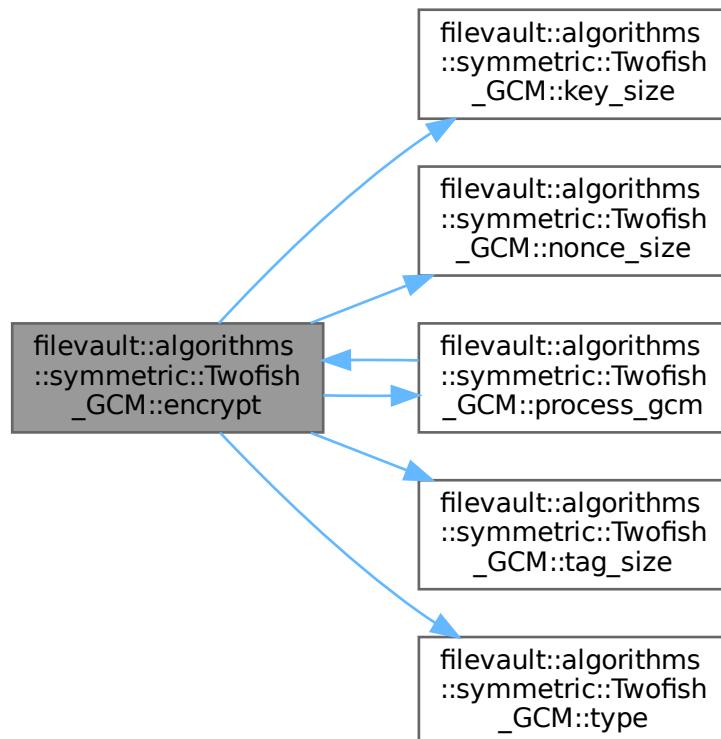

<code>key</code>	Encryption key (size depends on <code>key_bits</code>)
<code>config</code>	Encryption configuration with nonce

Returns

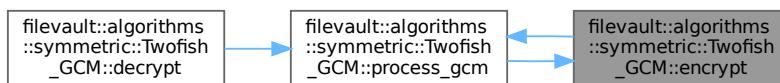

Encrypted data with authentication tag

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.88.3.3 is_suitable_for()**

```
bool filevault::algorithms::symmetric::Twofish_GCM::is_suitable_for (
    core::SecurityLevel level) const [override], [virtual]
```

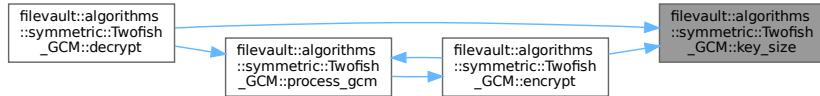

Check if algorithm is suitable for security level.
Implements [filevault::core::ICryptoAlgorithm](#).

9.88.3.4 key_size()

```
size_t filevault::algorithms::symmetric::Twofish_GCM::key_size () const [override], [virtual]
Get required key size in bytes.
```

Implements [filevault::core::ICryptoAlgorithm](#).

Here is the caller graph for this function:

9.88.3.5 name()

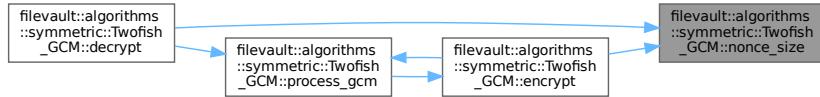

```
std::string filevault::algorithms::symmetric::Twofish_GCM::name () const [override], [virtual]
Get algorithm name.
```

Implements [filevault::core::ICryptoAlgorithm](#).

9.88.3.6 nonce_size()

```
size_t filevault::algorithms::symmetric::Twofish_GCM::nonce_size () const [inline]
Get nonce size in bytes (12 for GCM).
```

Here is the caller graph for this function:

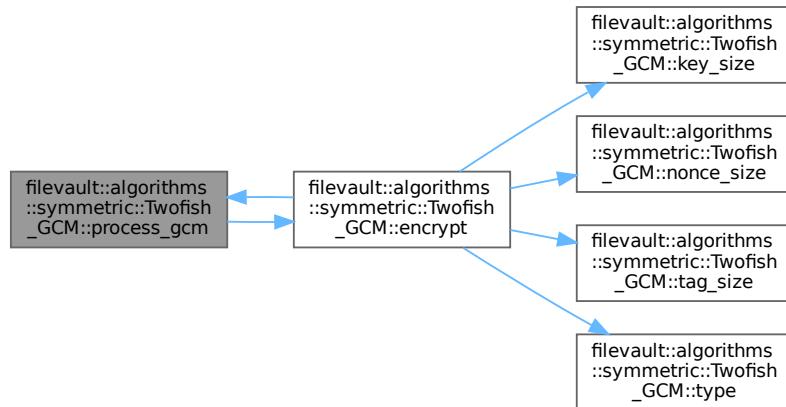

9.88.3.7 process_gcm()

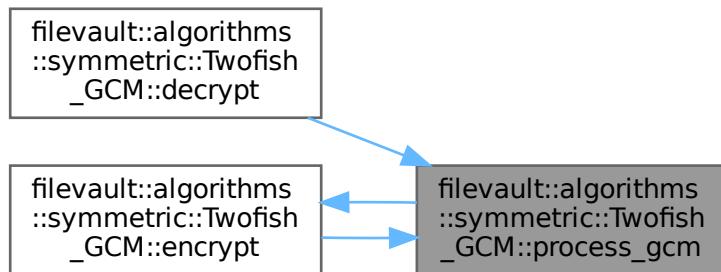

```
std::vector< uint8_t > filevault::algorithms::symmetric::Twofish_GCM::process_gcm (
    std::span< const uint8_t > input,
    std::span< const uint8_t > key,
    std::span< const uint8_t > nonce,
    std::span< const uint8_t > tag,
    bool encrypt) [private]
```

Perform encryption/decryption operation.

Here is the call graph for this function:

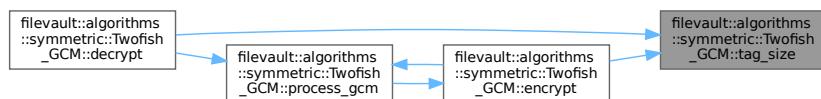

Here is the caller graph for this function:

9.88.3.8 tag_size()

```
size_t filevault::algorithms::symmetric::Twofish_GCM::tag_size () const [inline]

9.90.3.14 type() [2/2]

```
core::AlgorithmType filevault::algorithms::classical::Vigenere::type () const [inline], [override],  
[virtual]  
Get algorithm type.  
Implements filevault::core::ICryptoAlgorithm.
```

9.90.4 Member Data Documentation

9.90.4.1 keyword_

```
std::string filevault::algorithms::classical::Vigenere::keyword_ [private]  
The documentation for this class was generated from the following files:
```

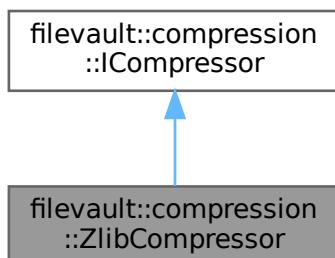

- include/filevault/algorithms/classical/[classical_ciphers.hpp](#)
- include/filevault/algorithms/classical/[vigenere.hpp](#)
- src/algorithms/classical/[classical_ciphers.cpp](#)
- src/algorithms/classical/[vigenere.cpp](#)

9.91 filevault::compression::ZlibCompressor Class Reference

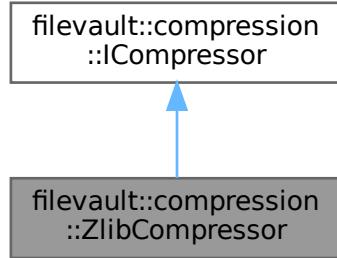

ZLIB compressor (fast, good compression).

```
#include <compressor.hpp>
```

Inheritance diagram for filevault::compression::ZlibCompressor:

Collaboration diagram for filevault::compression::ZlibCompressor:

Public Member Functions

- std::string `name () const override`
Get compressor name.
- `CompressionResult compress (std::span< const uint8_t > input, int level=6) override`
Compress data.
- `CompressionResult decompress (std::span< const uint8_t > input) override`
Decompress data.

Public Member Functions inherited from [filevault::compression::ICompressor](#)

- virtual `~ICompressor ()=default`

9.91.1 Detailed Description

ZLIB compressor (fast, good compression).

9.91.2 Member Function Documentation

9.91.2.1 `compress()`

```
CompressionResult filevault::compression::ZlibCompressor::compress (
    std::span< const uint8_t > input,
    int level = 6) [override], [virtual]
```

Compress data.

Parameters

<code>input</code>	Data to compress
<code>level</code>	Compression level (1-9, algorithm-specific)

Returns

Compressed data

Implements [filevault::compression::ICompressor](#).

9.91.2.2 decompress()

```
CompressionResult filevault::compression::ZlibCompressor::decompress (
    std::span< const uint8_t > input) [override], [virtual]
Decompress data.
```

Parameters

<i>input</i>	Compressed data
--------------	-----------------

Returns

Decompressed data

Implements [filevault::compression::ICompressor](#).

9.91.2.3 name()

```
std::string filevault::compression::ZlibCompressor::name () const [inline], [override], [virtual]
Get compressor name.
```

Implements [filevault::compression::ICompressor](#).

The documentation for this class was generated from the following files:

- [include/filevault/compression/compressor.hpp](#)
- [src/compression/compressor.cpp](#)

Chapter 10

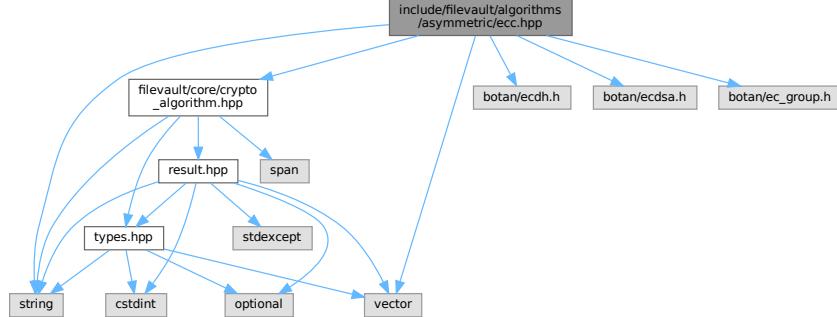

File Documentation

10.1 include/filevault/algorithms/asymmetric/ecc.hpp File Reference

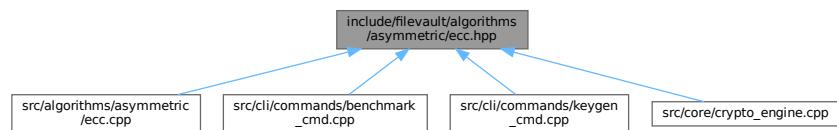

Elliptic Curve Cryptography (ECC) implementation.

```
#include "filevault/core/crypto_algorithm.hpp"
#include <botan/ecdh.h>
#include <botan/ecdsa.h>
#include <botan/ec_group.h>
#include <string>
#include <vector>
```

Include dependency graph for ecc.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct `filevault::algorithms::asymmetric::ECCKeyPair`
ECC key pair (ECDH or ECDSA).
- struct `filevault::algorithms::asymmetric::ECDHResult`
ECDH Key Exchange result.

- struct `filevault::algorithms::asymmetric::ECDSSignResult`
`ECDSSignature result.`
- class `filevault::algorithms::asymmetric::ECDH`
`Elliptic Curve Diffie-Hellman (ECDH) key exchange.`
- class `filevault::algorithms::asymmetric::ECDSA`
`Elliptic Curve Digital Signature Algorithm (ECDSA).`
- class `filevault::algorithms::asymmetric::ECCHybrid`
`Hybrid encryption using ECDH + AES-GCM.`

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::asymmetric`

Enumerations

- enum class `filevault::algorithms::asymmetric::ECCurve` { `filevault::algorithms::asymmetric::SECP256R1` , `filevault::algorithms::asymmetric::SECP384R1` , `filevault::algorithms::asymmetric::SECP521R1` , `filevault::algorithms::asymmetric::X25519` }

Supported elliptic curves.

10.1.1 Detailed Description

Elliptic Curve Cryptography (ECC) implementation.

Provides ECDH key exchange and ECDSA digital signatures using standard NIST curves.

10.2 ecc.hpp

10.19 include/filevault/algorithms/symmetric/aes_cbc.hpp File Reference

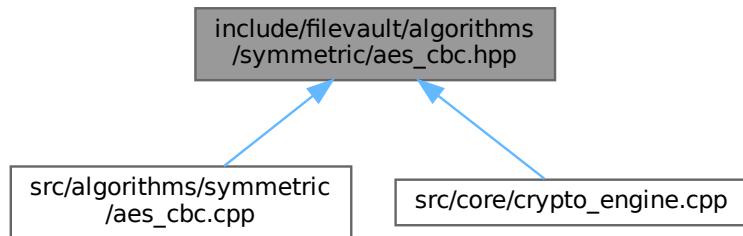

AES-CBC encryption implementation.

```
#include "filevault/core/crypto_algorithm.hpp"
#include <botan/cipher_mode.h>
```

Include dependency graph for aes_cbc.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class `filevault::algorithms::symmetric::AES_CBC`
AES-CBC encryption (legacy mode, not authenticated).

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.19.1 Detailed Description

AES-CBC encryption implementation.

AES in Cipher Block Chaining mode - classic block cipher mode. NOT authenticated - use with HMAC for integrity protection.

Warning

CBC mode is NOT AEAD - no built-in authentication! Consider using AES-GCM instead for authenticated encryption.

10.20 aes_cbc.hpp

10.21.1 Detailed Description

AES-CFB (Cipher Feedback) mode encryption.

CFB mode is a stream cipher mode that turns a block cipher into a self-synchronizing stream cipher. It's similar to CBC but encrypts the previous ciphertext block instead of XORing.

10.35.1 Detailed Description

Camellia-GCM AEAD encryption algorithm.

Camellia is a Japanese symmetric key block cipher developed by Mitsubishi Electric and NTT. It's approved by ISO/IEC, CRYPTREC, and NESSIE. It has similar security level to AES.

10.36 camellia_gcm.hpp

10.41.1 Detailed Description

SM4-GCM AEAD encryption algorithm.

SM4 (formerly SMS4) is a Chinese national standard block cipher used in wireless LAN standard WAPI. It was made a national standard (GB/T 32907-2016) in 2016 and is widely used in China. SM4 uses 128-bit key and 128-bit block size.

#include <botan/pk_keys.h>
#include <botan/kyber.h>
#include <botan/dilithium.h>
#include <botan/secmem.h>
#include <spdlog/spdlog.h>
#include <chrono>
  
```

Include dependency graph for post_quantum.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::pqc`

Functions

- static Botan::KyberMode `filevault::algorithms::pqc::get_kyber_mode` (`Kyber::Variant` variant)
- static Botan::DilithiumMode `filevault::algorithms::pqc::get_dilithium_mode` (`Dilithium::Variant` variant)

10.128.1 Detailed Description

Post-Quantum Cryptography implementations using Botan 3.x.

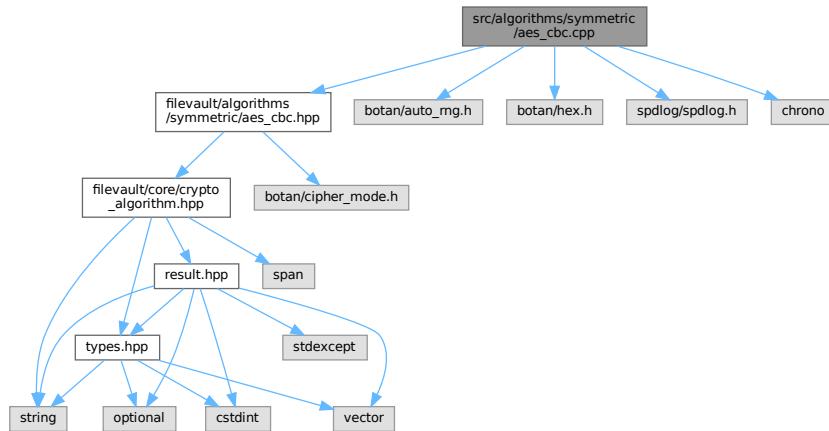

Implements Kyber (ML-KEM) and Dilithium (ML-DSA) from NIST PQC standards.

10.129 src/algorithms/symmetric/aes_cbc.cpp File Reference

AES-CBC encryption implementation.

```
#include "filevault/algorithms/symmetric/aes_cbc.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <chrono>
```

Include dependency graph for aes_cbc.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.129.1 Detailed Description

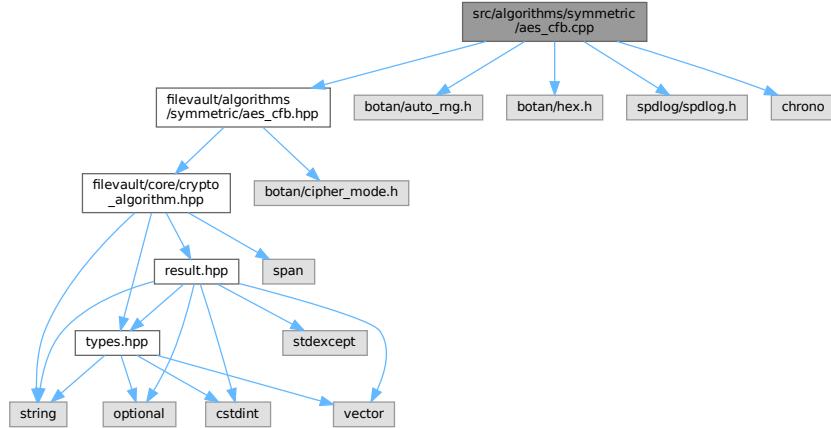

AES-CBC encryption implementation.

10.130 src/algorithms/symmetric/aes_cfb.cpp File Reference

AES-CFB encryption implementation.

```
#include "filevault/algorithms/symmetric/aes_cfb.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <chrono>
```

Include dependency graph for aes_cfb.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.130.1 Detailed Description

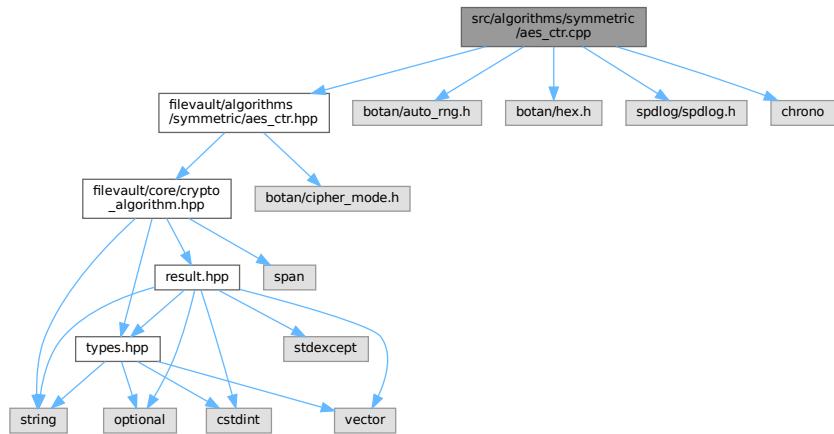

AES-CFB encryption implementation.

10.131 src/algorithms/symmetric/aes_ctr.cpp File Reference

AES-CTR encryption implementation.

```
#include "filevault/algorithms/symmetric/aes_ctr.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <chrono>
```

Include dependency graph for aes_ctr.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.131.1 Detailed Description

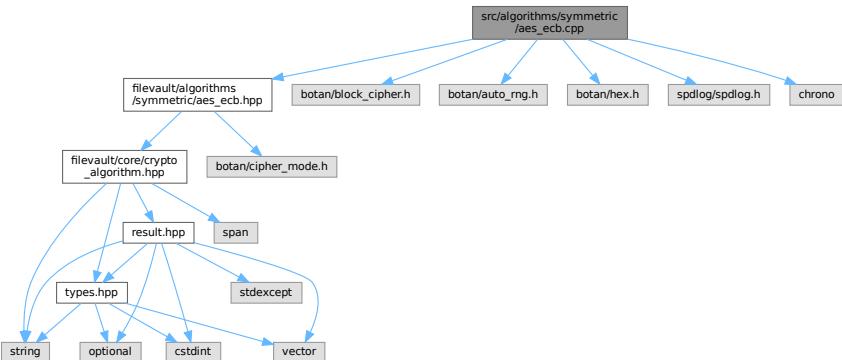

AES-CTR encryption implementation.

10.132 src/algorithms/symmetric/aes_ecb.cpp File Reference

AES-ECB encryption implementation.

```
#include "filevault/algorithms/symmetric/aes_ecb.hpp"
#include <botan/block_cipher.h>
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <chrono>
```

Include dependency graph for aes_ecb.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

Functions

- static `std::vector< uint8_t > filevault::algorithms::symmetric::add_pkcs7_padding (std::span< const uint8_t > data, size_t block_size)`
- static `std::vector< uint8_t > filevault::algorithms::symmetric::remove_pkcs7_padding (std::span< const uint8_t > data)`

10.132.1 Detailed Description

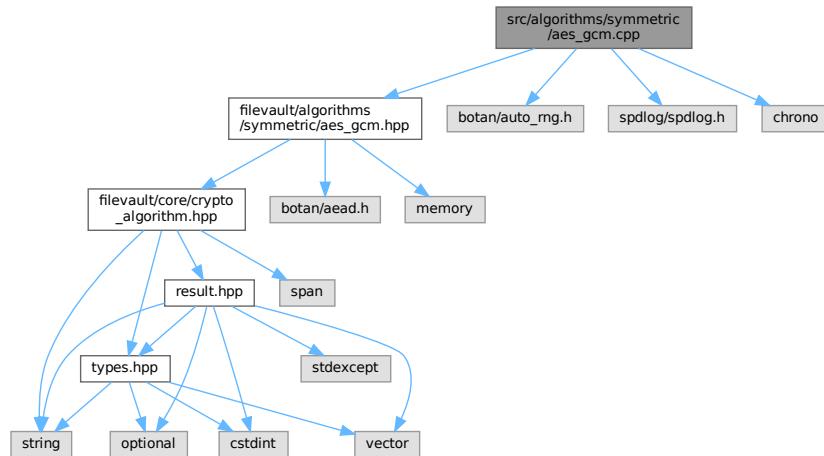

AES-ECB encryption implementation.

WARNING: ECB mode is NOT secure for most uses!

Note: Botan 3.x doesn't expose ECB through `Cipher_Mode`, so we use `BlockCipher` directly with manual PKCS7 padding.

10.133 src/algorithms/symmetric/aes_gcm.cpp File Reference

```
#include "filevault/algorithms/symmetric/aes_gcm.hpp"
#include <botan/auto_rng.h>

#include <chrono>
Include dependency graph for aes_gcm.cpp:
```

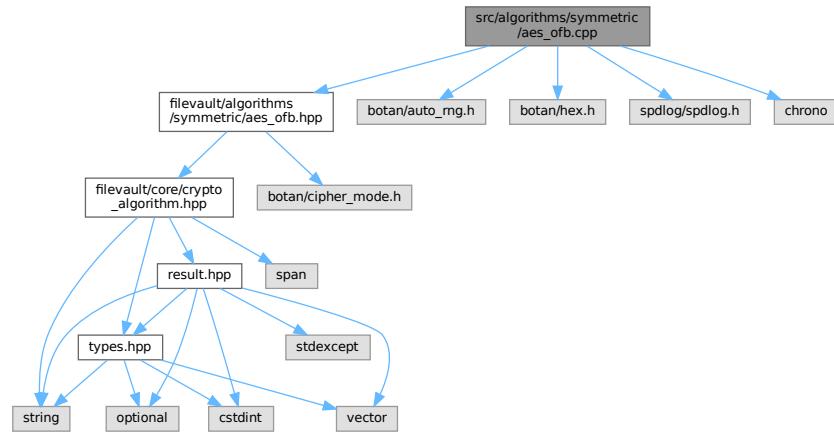

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.134 src/algorithms/symmetric/aes_ofb.cpp File Reference

AES-OFB encryption implementation.

```
#include "filevault/algorithms/symmetric/aes_ofb.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <chrono>
Include dependency graph for aes_ofb.cpp:
```

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.134.1 Detailed Description

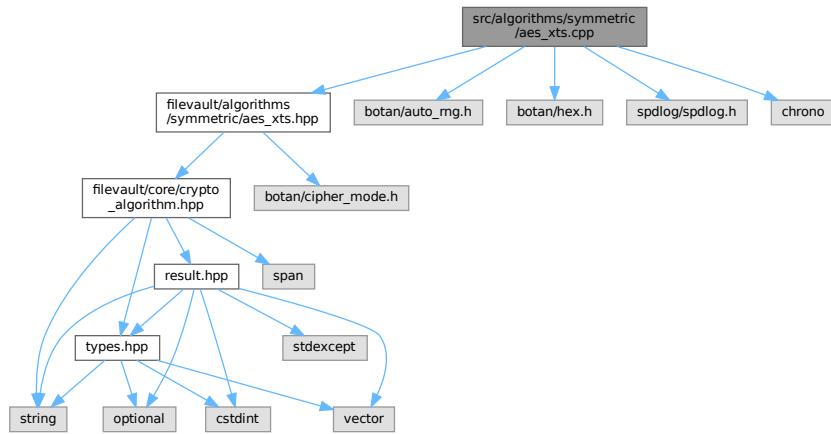

AES-OFB encryption implementation.

10.135 src/algorithms/symmetric/aes_xts.cpp File Reference

AES-XTS encryption implementation for disk encryption.

```
#include "filevault/algorithms/symmetric/aes_xts.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <chrono>
```

Include dependency graph for aes_xts.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.135.1 Detailed Description

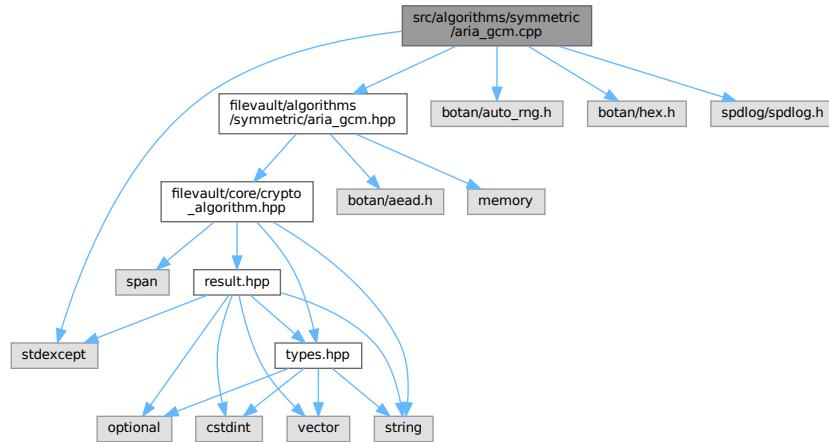

AES-XTS encryption implementation for disk encryption.

10.136 src/algorithms/symmetric/aria_gcm.cpp File Reference

Implementation of ARIA-GCM AEAD encryption.

```
#include "filevault/algorithms/symmetric/aria_gcm.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <stdexcept>
```

Include dependency graph for aria_gcm.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.136.1 Detailed Description

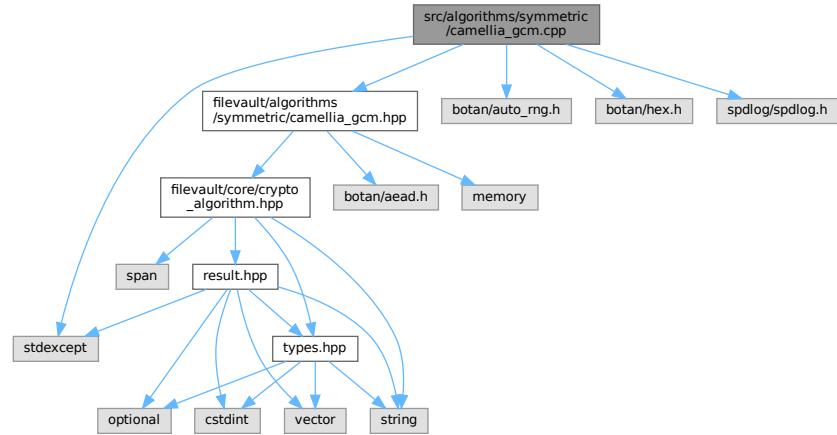

Implementation of ARIA-GCM AEAD encryption.

10.137 src/algorithms/symmetric/camellia_gcm.cpp File Reference

Implementation of Camellia-GCM AEAD encryption.

```
#include "filevault/algorithms/symmetric/camellia_gcm.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <stdexcept>
```

Include dependency graph for camellia_gcm.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

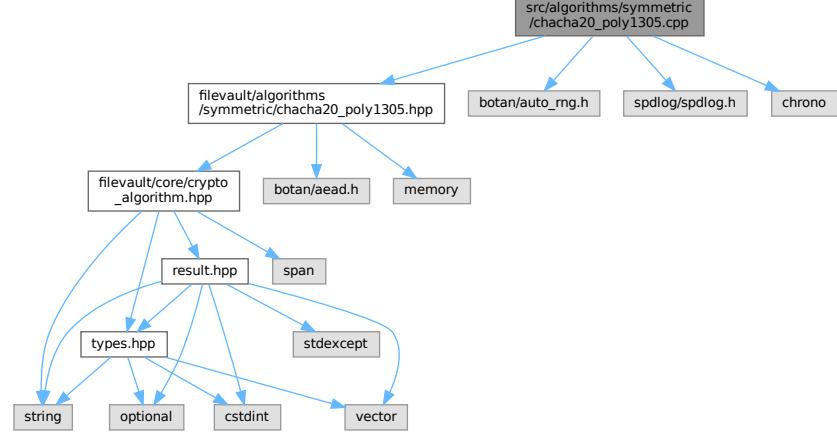

10.137.1 Detailed Description

Implementation of Camellia-GCM AEAD encryption.

10.138 src/algorithms/symmetric/chacha20_poly1305.cpp File Reference

```
#include "filevault/algorithms/symmetric/chacha20_poly1305.hpp"
#include <botan/auto_rng.h>

#include <stdexcept>
#include <chrono>
```

Include dependency graph for serpent_gcm.cpp:

Namespaces

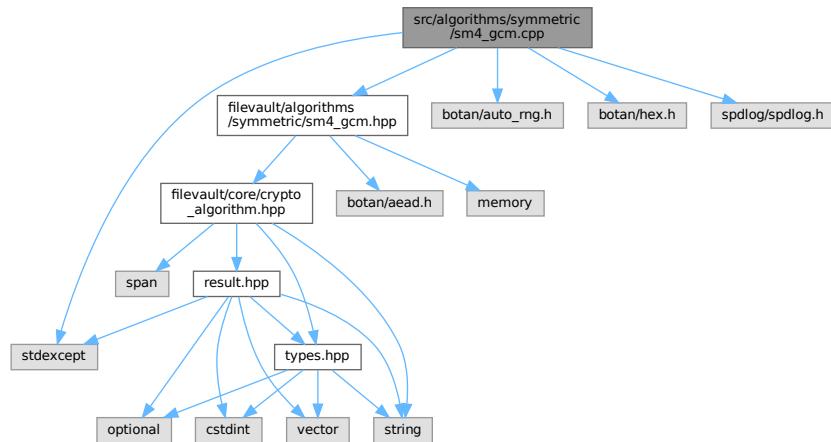

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.140 src/algorithms/symmetric/sm4_gcm.cpp File Reference

Implementation of SM4-GCM AEAD encryption.

```
#include "filevault/algorithms/symmetric/sm4_gcm.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <stdexcept>
```

Include dependency graph for sm4_gcm.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.140.1 Detailed Description

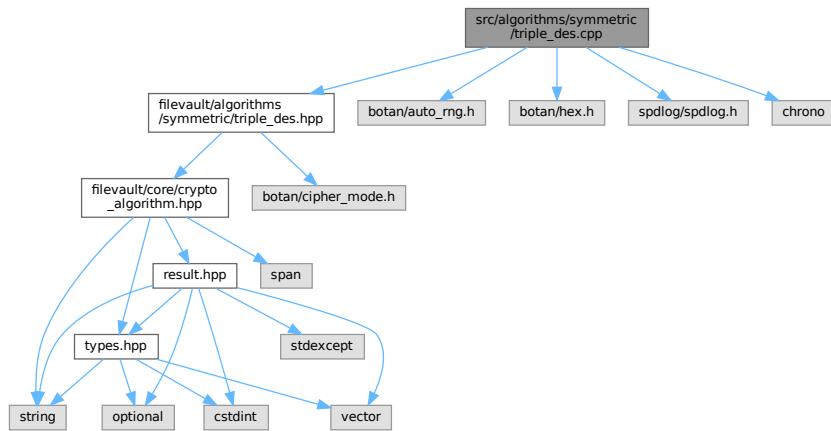

Implementation of SM4-GCM AEAD encryption.

10.141 src/algorithms/symmetric/triple_des.cpp File Reference

Triple-DES (3DES) encryption implementation.

```
#include "filevault/algorithms/symmetric/triple_des.hpp"
#include <botan/auto_rng.h>
#include <botan/hex.h>
#include <spdlog/spdlog.h>
#include <chrono>
```

Include dependency graph for triple_des.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.141.1 Detailed Description

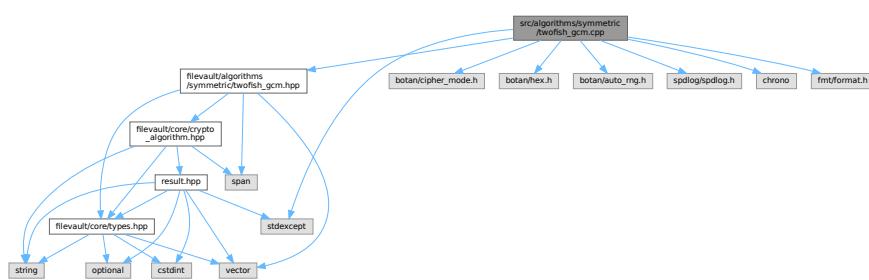

Triple-DES (3DES) encryption implementation.

10.142 src/algorithms/symmetric/twofish_gcm.cpp File Reference

Twofish-GCM encryption implementation.

```
#include "filevault/algorithms/symmetric/twofish_gcm.hpp"
#include <botan/cipher_mode.h>
#include <botan/hex.h>
#include <botan/auto_rng.h>
#include <spdlog/spdlog.h>
#include <stdexcept>
#include <chrono>
#include <fmt/format.h>
```

Include dependency graph for twofish_gcm.cpp:

Namespaces

- namespace `filevault`
- namespace `filevault::algorithms`
- namespace `filevault::algorithms::symmetric`

10.142.1 Detailed Description

Twofish-GCM encryption implementation.

Uses Botan's Twofish/GCM mode for authenticated encryption
